3 *Multiple Regression Models assessing the contributors to breakthrough parasitaemia*

4

5 The MLR equation is written as the generalized linear model for the *logit* function as follows:

6

8 
$$\text{logit}(p) = \beta_0 + \beta_1x_1 + \beta_2x_2 \dots \dots \dots + \beta_mx_m$$

7

9 where,  $p$  is the probability of having positive parasitaemia on D28,  $\beta_0$  is the intercept, and  $\beta_i$   
10 is the regression coefficient indicating the relative effect of variable  $x_i$ . The values of model  
11 parameters were determined by maximizing the log likelihood function across  $n$   
12 observations of outcomes

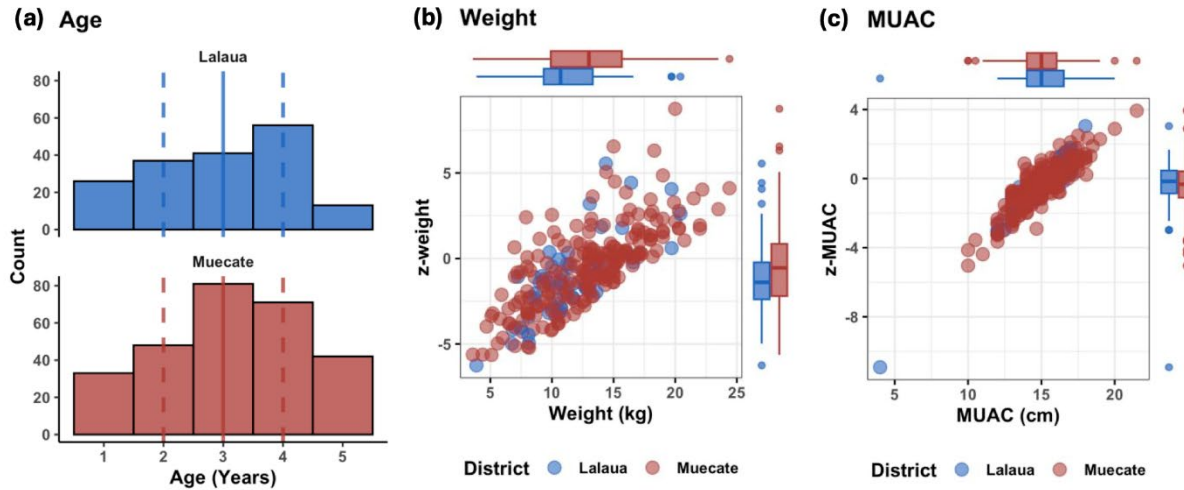

13 
$$l(p) = \sum_{i=1}^n y_i \log(p) + (1 - y_i) \log(1 - p)$$

14 where,  $y_i = 1$  when D28 parasitaemia was positive and  $y_i = 0$  when D28 parasitaemia was  
15 negative. The MLR analysis was performed by constructing models using nine possible  
16 predictors; age, weight, z-score of weight, MUAC, z-score of MUAC, D7 capillary blood levels  
17 of sulphadoxine, pyrimethamine, and desethylamodiaquine, and the AUC from D7 to D28 of  
18 desethylamodiaquine levels. A total of 511 models were constructed using all possible  
19 combinations of the nine variables. The models were fitted with the same dataset from 162  
20 patients.

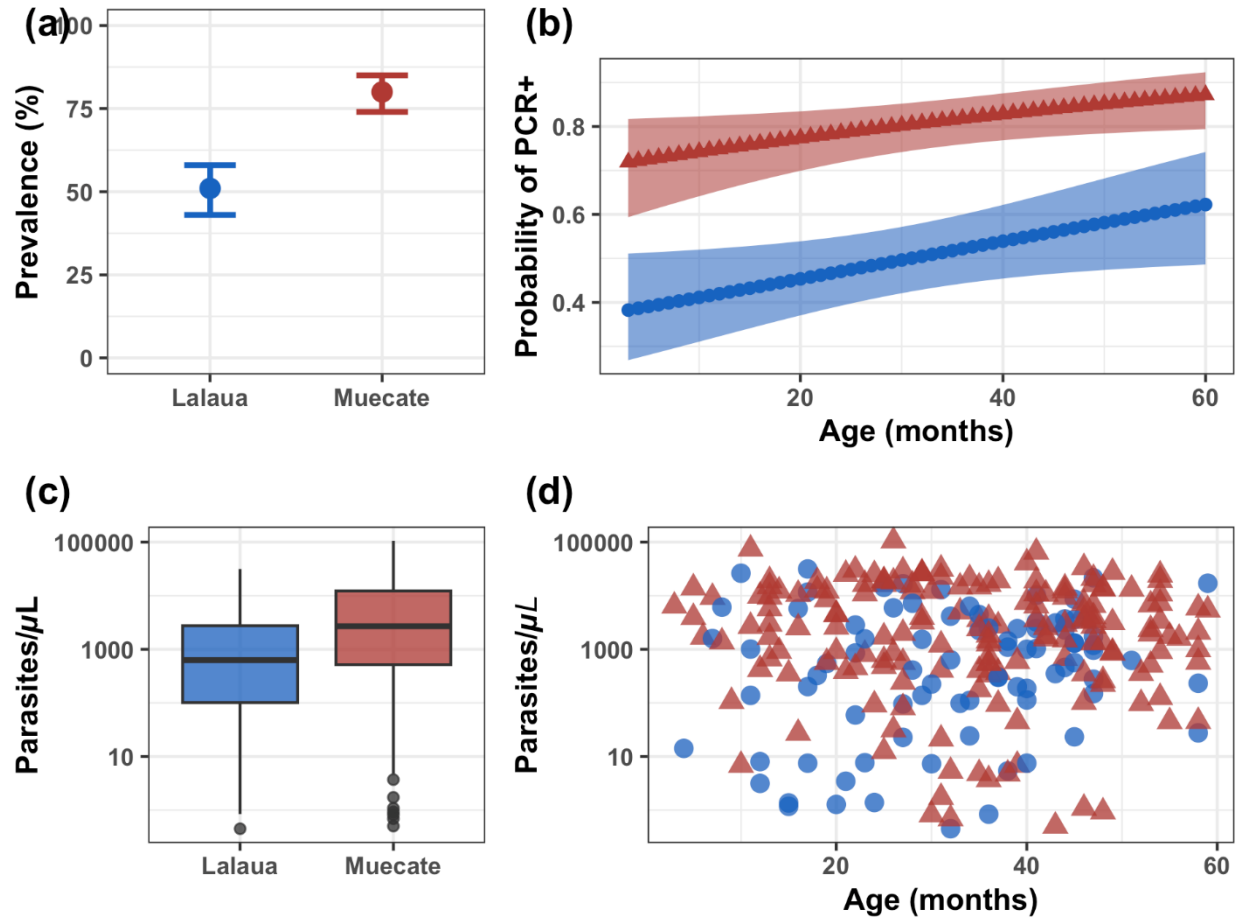

21

22 **Supplementary Figures**

23 **Figure S1:** Demographic characteristics of participants. (a) Age distribution by district. Solid  
24 lines indicate medians and dashed lines represent interquartile ranges (IQRs). (b) Body  
25 weights and corresponding z-scores. (c) Mid-upper arm circumferences (MUAC) and  
26 corresponding z-scores.

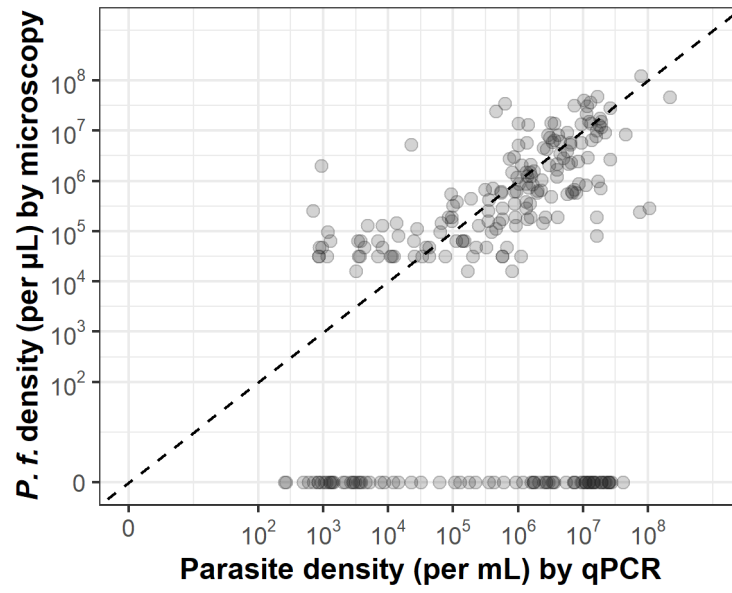

27  
28  
29  
30

31  
 32 **Figure S2:** Baseline malaria characteristics. **(a)** Malaria prevalence by district, with 95%  
 33 confidence intervals (CIs). **(b)** Estimated probability of testing PCR-positive on Day 0. **(c)**  
 34 Geometric mean (95%CI) baseline parasite densities by site. **(d)** Baseline parasite densities  
 35 stratified by age (blue circles-Lalaua, red triangles Muecate).

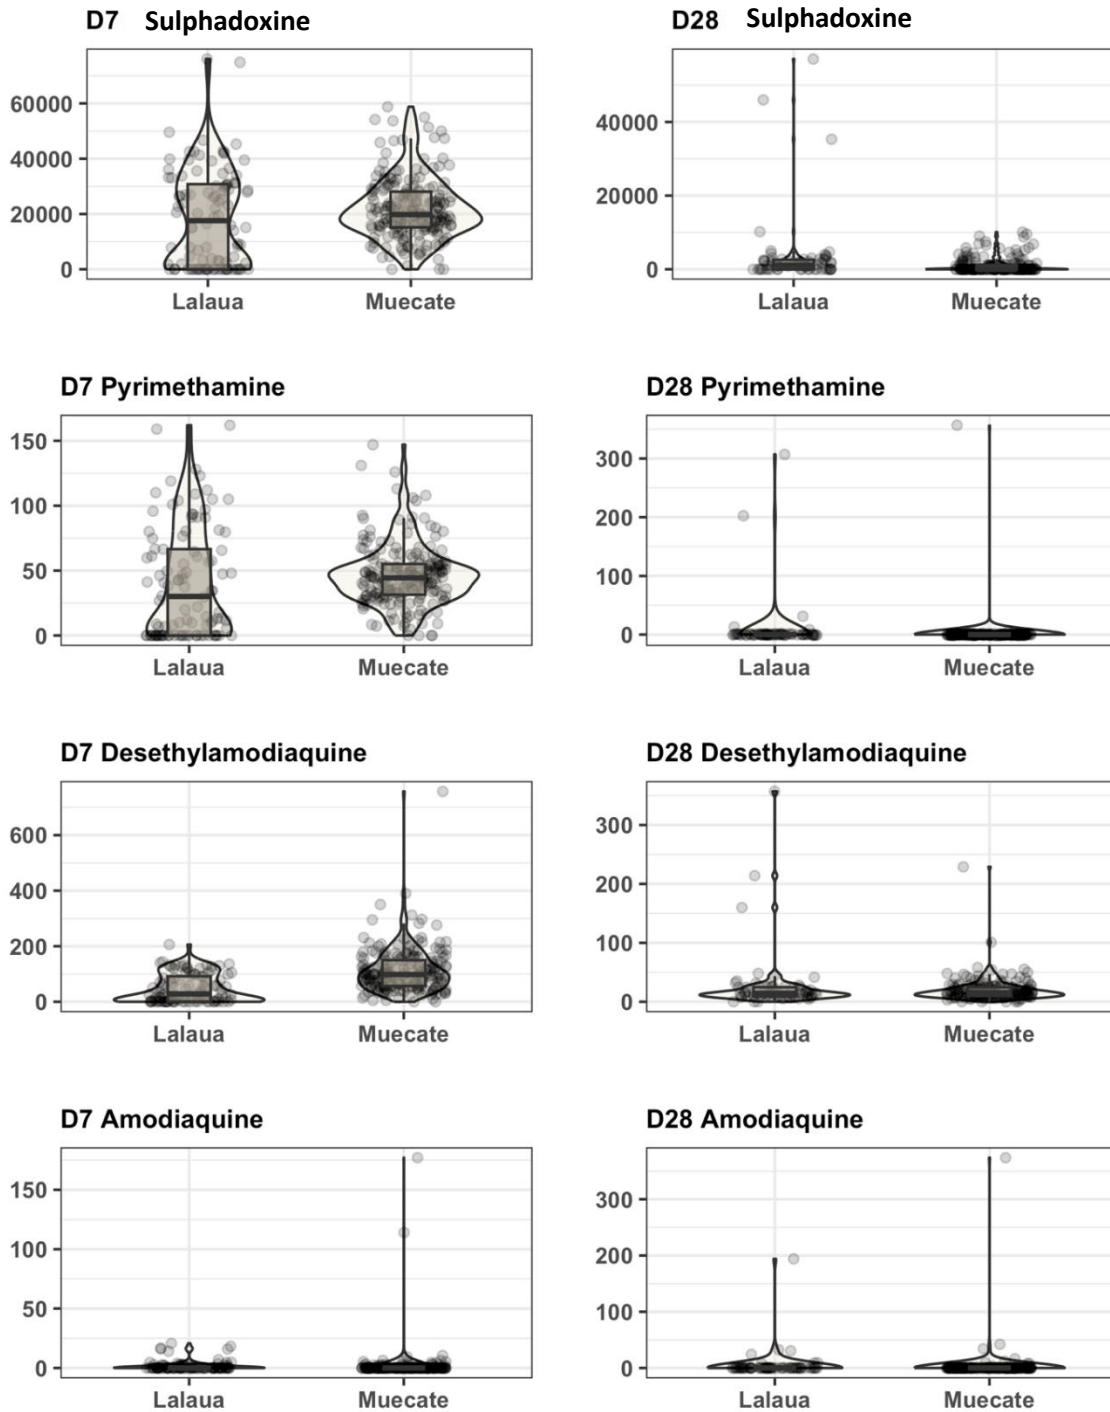

36

37 **Figure S3:** Correlation between microscopy and qPCR estimates of parasite densities

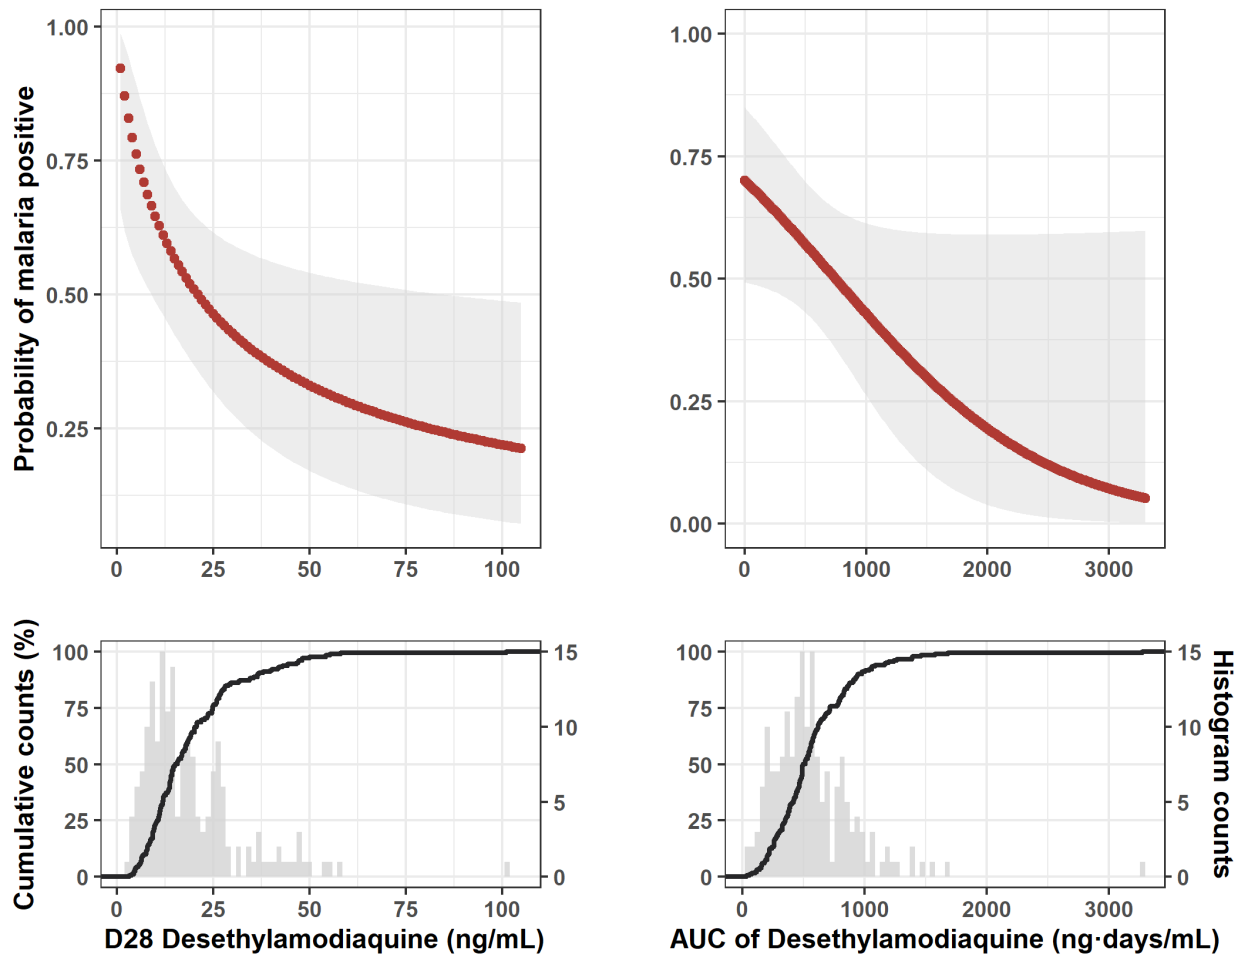

38 **Figure S4:** Capillary whole blood drug levels by site. Sulphadoxine and pyrimethamine are  
39 co-formulated in the same tablet. Desethylamodiaquine is the bioactive desethyl  
40 metabolite of amodiaquine.

41

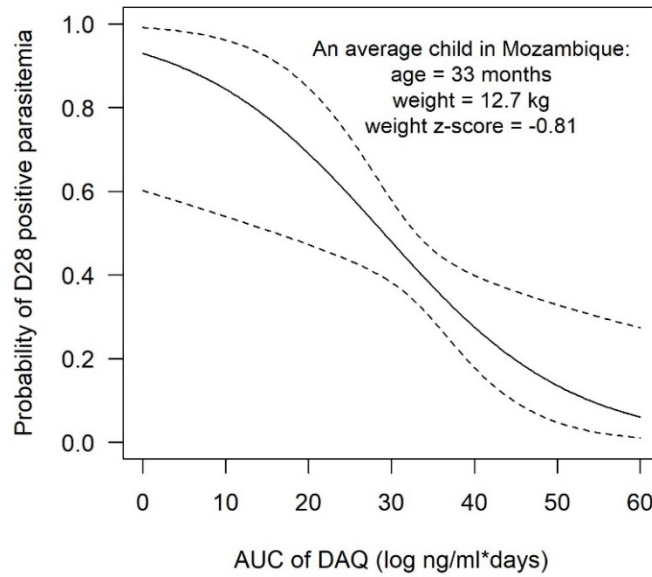

42 **Figure S5a:** Predicted probability of testing malaria-positive at D28 as a function of (right)  
43 D28 desethylamodiaquine concentration and (left) desethylamodiaquine exposure  
44 between day 7 and day 28. (Top) Predicted probabilities were estimated using a logistic  
45 regression model that adjusts for age (modeled with a smooth term), geographical location,  
46 and calendar time. The predictions assume a median child age of 33 months, in Muecate  
47 district, on 2022-02-25. Shaded areas represent the 95% confidence interval (CI). **(Bottom)**  
48 Distribution of D28 desethylamodiaquine concentrations and desethylamodiaquine  
49 exposures. Histogram counts (pale grey) are shown on the right y-axis, while the cumulative  
50 count is displayed on the left y-axis (thick line).

51

52

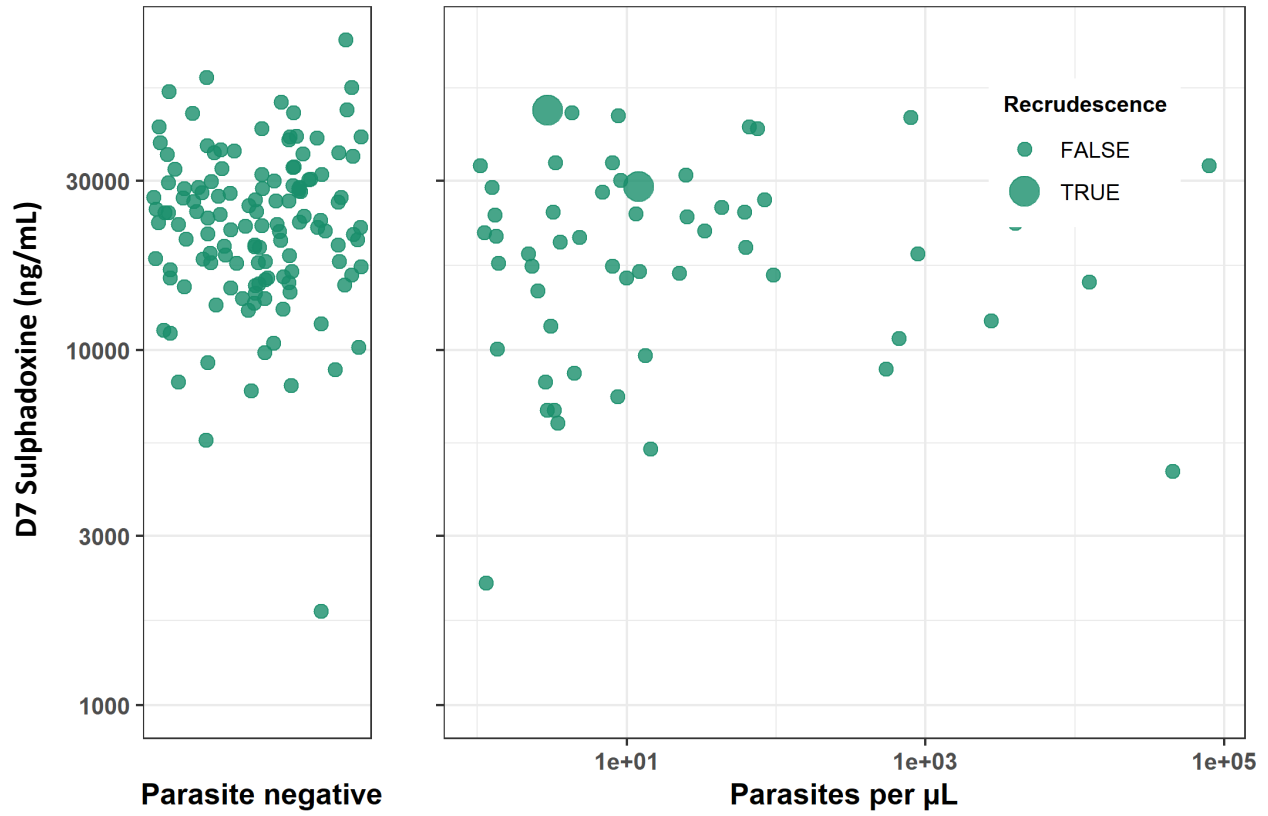

53 **Figure S5b.** The probability of an average child in the Mozambique study sites (aged 33  
54 months old, weight 12.7 kg, Z-score = -0.81) being parasitaemic on D28 in relation to the  
55  $AUC_{7-28}$  of whole blood desethyl amodiaquine (DAQ) levels derived from the multiple  
56 regression model. Dashed lines represent 95%CI.

57  
58  
59  
60  
61  
62

63 **Figure S6.** Day 7 whole capillary blood sulphadoxine concentrations in children whose  
64 blood samples were malaria parasite negative at D28 compared with those who were  
65 parasitaemic.

66

67

68

69

70

71

72 **Figure S7.** Day 7 capillary whole blood pyrimethamine concentrations in children whose  
73 blood samples were malaria parasite negative at D28 compared with those who were  
74 parasitaemic.

75

76

77

78 **Figure S8.** Proportions (95%CI) of children who were malaria parasitaemic on D28 in relation  
79 to the preceding day 7 sulphadoxine (left) and pyrimethamine (right) concentrations.

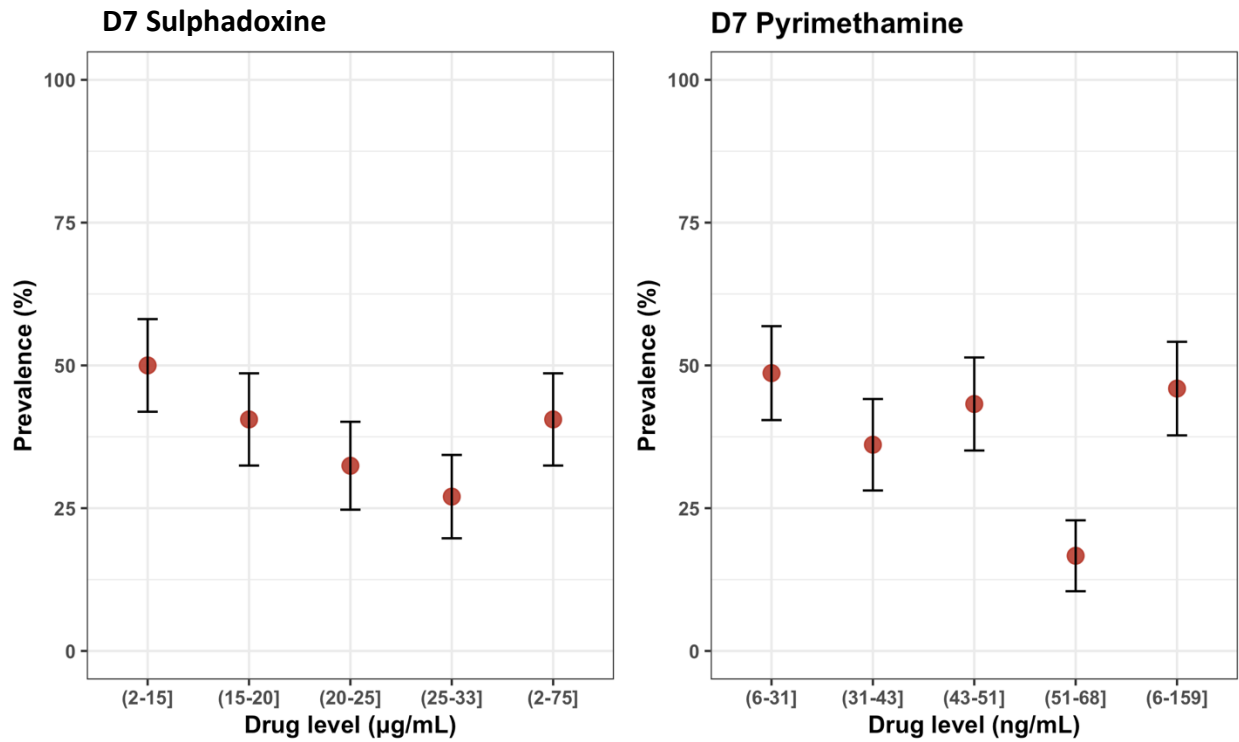

80

81

82

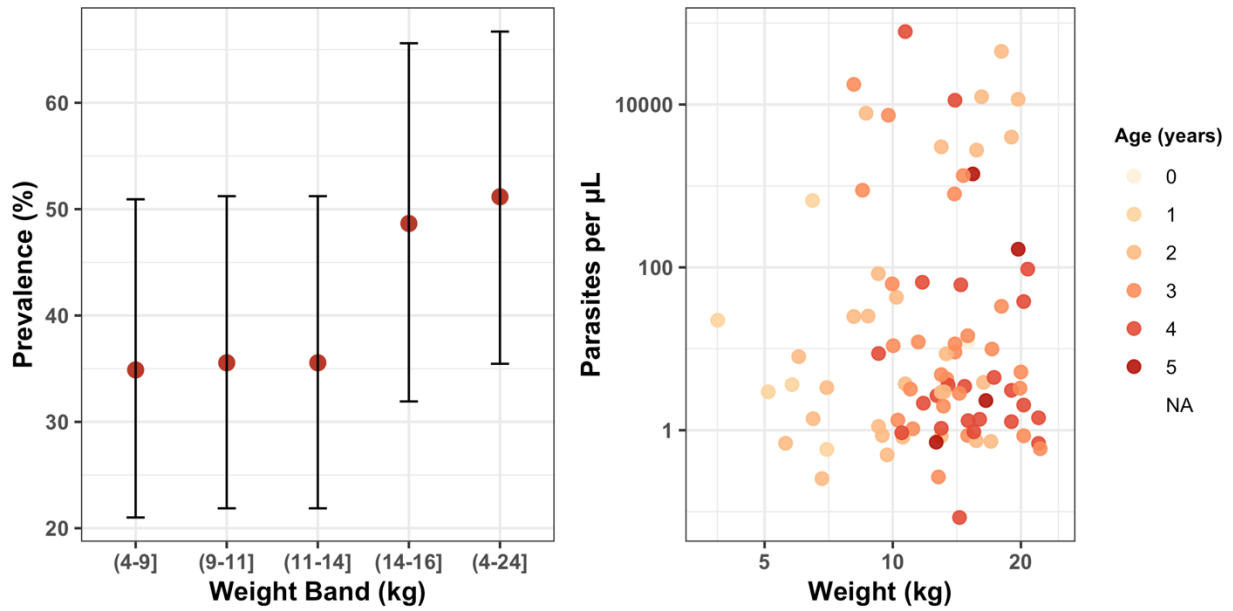

83

84

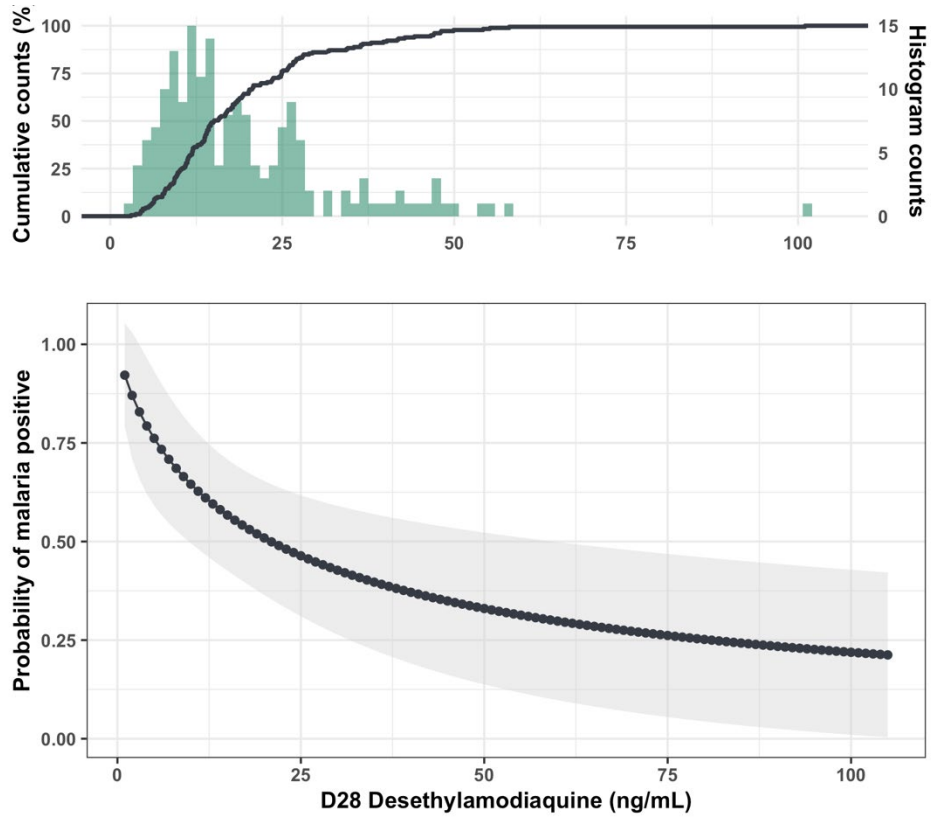

85 **Figure S9:** Relationship between malaria prevalence and parasite density across different  
86 weight bands. (a) malaria prevalence for each weight band, with error bars representing the  
87 95% confidence intervals. (b) Parasite density in relation to weight, with data points colour-  
88 coded by age group

111

112

113 **Supplementary Tables**

114 **Table S1:** The prevalence of malaria based on samples collected from children with data  
 115 available for both dates.

	<b>Before SMC</b>	<b>After SMC</b>
Malaria positive (PCR)	139/194 (72%)	88/194 (45%)
<i>P. falciparum</i>	127/194 (66%)	83/194 (43%)
<i>P. ovale</i>	54/194 (28%)	2/194 (1%)
<i>P. vivax</i>	1/194 (0.5%)	0/194 (0%)
<i>P. malariae</i>	0/194 (0%)	0/194 (0%)
Undetermined*	4/194 (2%)	2/194 (4%)

116 Data are presented as n (%)

117 \*If there was insufficient DNA then the malaria species could not be determined.

118

119 **Table S2.** Details of recrudescent *P. falciparum* infections.

	<b>Age (months)</b>	<b>Parasite density (per mL) at D28</b>	<b>Desethylamodiaquine concentration (ng/mL) at D28</b>
1	26	7,380,303	5.24
2	11	2,962	14.4
3	4	12,054	20.6

120

121

122

123 **Table S3: Summary of detectable drug levels**

<b>Drug name</b>	<b>Detectable Samples (n)</b>	<b>Geometric mean (ng/mL)</b>	<b>Minimum (ng/mL)</b>	<b>Maximum (ng/mL)</b>
<b>Sulphadoxine</b>				
D7	270/301	19402	1300	76100
D28	102/248	2349	843	57100
<b>Pyrimethamine</b>				
D7	266/301	42	4.67	162
D28*	7/248	45	4.53	356
<b>Amodiaquine</b>				
D7	54/302	4	1.88	177
D28*	19/251	14	2.05	374
<b>Desethylamodiaquine</b>				
D7	274/302	74	3.19	757
D28	243/251	8	3.01	357

124 \* All detectable levels of sulphadoxine and amodiaquine were suspected to result from participants  
 125 receiving their second round of SMC before, rather than after, the blood sample was taken.

126

127 Table S4: STROBE checklist

128 STROBE Statement—Checklist of items that should be included in reports of *cohort studies*

129

	Item No	Recommendation	Line No
<b>Title and abstract</b>	1	(a) Indicate the study’s design with a commonly used term in the title or the abstract	1-3
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	33-56
<b>Introduction</b>			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	61-75
Objectives	3	State specific objectives, including any prespecified hypotheses	75-78
<b>Methods</b>			
Study design	4	Present key elements of study design early in the paper	77-78, 84-85
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	82-84 86-98 101-117
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up  (b) For matched studies, give matching criteria and number of exposed and unexposed	101-107
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	122-134
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	137-141
Bias	9	Describe any efforts to address potential sources of bias	
Study size	10	Explain how the study size was arrived at	
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	136-141
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding  (b) Describe any methods used to examine subgroups and interactions	136-141

		(c) Explain how missing data were addressed	154-238
		(d) If applicable, explain how loss to follow-up was addressed	
		(e) Describe any sensitivity analyses	
<b>Results</b>			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed (b) Give reasons for non-participation at each stage (c) Consider use of a flow diagram	Fig 1
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders (b) Indicate number of participants with missing data for each variable of interest (c) Summarise follow-up time (eg, average and total amount)	Tables 144-167
Outcome data	15*	Report numbers of outcome events or summary measures over time	169-265

Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included  (b) Report category boundaries when continuous variables were categorized  (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	169-265
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	supplement
<b>Discussion</b>			
Key results	18	Summarise key results with reference to study objectives	268-356
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	3183-343
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	343-356
Generalisability	21	Discuss the generalisability (external validity) of the study results	353-356
<b>Other information</b>			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	380-385
