The analyses listed in Table 21 come from a number of different sources. Objects 1-7 were analysed by X-ray fluorescence by van Zelst and Meyers in the Metropolitan Museum of Art, and will be published by Melikian-Chirvani in his forthcoming article on the high tin bronzes of Khurāsān. Some of the objects are in the Metropolitan, others are in private collections. Since the writer has not been able to study the objects concerned and since they have not yet been published none of them have been included in the catalogue or the text of the thesis. The relevance of the analyses to the high tin bronze industry of Iran, however, demanded their inclusion. Objects 8-11, which are in the British Museum, were analysed by atomic absorption by Dr. Michael Hughes of the British Museum Research Laboratory. Objects 12-30, all of which are in the Louvre, were analysed in the Laboratoire de Recherche des Musées de France by emission spectrometry. Objects 31-65 were analysed in the Research Laboratory for Archaeology and the History of Art at Oxford by Dr. Alex Kaczmarczyk using X-ray fluorescence. Objects 31-45 are in the Ashmolean Museum and 46-65 are from the Siraf excavations. Objects 66-7 were chemically analysed by Professor E.R. Caley of Ohio State University, and the analyses were published by Dupree (1958 pp.291-2). Semi-quantitative spectrographic analyses of objects 68-9 were undertaken in Washington and published by Gettens and Waring (1959 p.88 nos.14-15).

Although each set of figures clearly indicates the principle elements in the alloy concerned, the range of information given regarding the less important elements varies from one set of results to another. Because of this, and also because of the different methods and machines used for the different analyses, the results should not be compared in
the smallest details. For this reason only the major elements have been taken as significant in the text of this thesis. The two or sometimes three readings given for many objects in the Paris and Oxford groups (12-30 and 31-65) underline the fact that an alloy does not contain exactly the same proportions of any given elements throughout its volume.

Certain analyses of uncatalogued objects are included in the Table in addition to those from the Metropolitan Museum of Art. These were done at the same time as the other objects in the relevant group and have been retained for the sake of completeness. The symbol x in an analysis means that the element was present in such large quantities that it could not be measured, and the symbol P means that the element was detectable but not measurable. Where no figure or symbol is given for an element it should be understood that that element was not sought by the analyst.

colln. collection; d. diameter; gr. grams; h. height; lg. length;
n.p. no provenance; nr. near; th. thickness; unp. unpublished;
w. width

"ex" before the name of a collection indicates that the object was last heard of in that collection but that its present whereabouts are unknown.
Catalogue Preface

Each catalogue entry is arranged as follows:-

Present location; provenance; exact date of manufacture; bibliography.
Metal; techniques used; parts missing; dimensions (in centimetres).
Description of object. Description of decoration. Craftsman's name.
(Analysis reference) (Figure reference)

Where certain aspects of such an entry are irrelevant, for example the
date and craftsman's name on an uninscribed object, these are omitted.
The name of a place as a provenance means that the object was excavated
there, unless otherwise stated. The Siraf material catalogued is des-
cribed as being in the Ashmolean Museum, Oxford. This is indeed its
temporary abode, but the description given is not intended to suggest
that it belongs to the Ashmolean or indeed is necessarily destined to
remain there. Where the provenance is unknown "n.p." (no provenance) is
used to indicate this fact, where it is unpublished "unp." is inserted
in the appropriate position. In the silver and gold section provenances
of objects which were found in a hoard are referred to by the name of
that hoard - Harari hoard, ValgIr hoard, Chimkent hoard or Nihavand
hoard. These hoards are discussed above (p.51 ). The bibliographical
references are not intended to be comprehensive, but to give the most
important reference or references for the purposes of the thesis. In
the references to metals the following usages should be noted. "Bronze"
means that the exact nature of the copper alloy is unknown; "lead bronze"
means a copper-tin alloy with added lead; "high tin bronze" means a
copper-tin alloy with more than about 17% tin in it; "quaternary alloy"
means an alloy consisting of copper, tin, lead and zinc; "brass" means
a copper-zinc alloy; "pewter" means a tin-lead alloy. In the catalogue
of scientific instruments the craftsman's name has been placed next to
the date of manufacture since it is by the craftsman's name that such
objects are commonly referred to.
