Title: USE OF IMINOSUGAR DERIVATIVES TO INHIBIT ION CHANNEL ACTIVITY

Abstract: Disclosed are methods and kits to treat HCV infection by administering an iminosugar derivative compound that is effective in inhibiting the activity of HCV p7 protein, and methods by which to screen for compounds that inhibit the activity of p7 protein or variants thereof. The disclosed N-substituted imino compounds, and pharmaceutical compositions thereof, inhibit the capability of HCV p7 to permeabilize membranes. Particularly efficacious compounds are imino sugars derived from N-alkylated piperidines. Also disclosed are methods for screening for potential HCV antiviral agents.
For two-letter codes and other abbreviations, refer to the "Guidance Notes on Codes and Abbreviations" appearing at the beginning of each regular issue of the PCT Gazette.
USE OF IMINOSUGAR DERIVATIVES TO INHIBIT ION CHANNEL ACTIVITY

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application claims priority to U.S. Provisional Application Serial No. 60/412,560, filed on September 23, 2002, incorporated herein by reference in its entirety.

BACKGROUND

[0002] Hepatitis C virus (HCV) is the major cause of chronic hepatitis with a significant risk of end-stage liver cirrhosis and hepatocellular carcinoma. (See Di Bisceglie, A.M., (1997) Hepatology 26(3 Suppl. 1): 345-385). HCV belongs to the family Flaviviridae, which consists of three genera: flaviviruses, pestiviruses, and hepaciviruses. In the absence of both a suitable small animal model and a reliable in vitro infectivity assay for HCV, potential antiviral drugs are initially tested using a related pestivirus, bovine viral diarrhea virus (BVDV). BVDV in vitro infectivity assays have been used to demonstrate that alkylated iminosugar derivatives containing either the glucose analogue 1,5-Dideoxy-1,5-imino-D-glucitol, also called deoxynojirimycin or “DNJ,” or the galactose analogue 1,5-Dideoxy-1,5-imino-D-galactitol, also called deoxygalactonojirimycin or “DGJ,” are potent antiviral inhibitors. (See Durantel, D., et al., (2001) J. Virol. 75(19): 8987-98).

[0003] DNJ derivatives are antiviral inhibitors at least partially because they inhibit ER α-glucosidases I and II. These enzymes remove three glucose

[0004] Previous experiments have shown that the antiviral effect of the long alkylchain derivative N-nonyl-DNJ (NN-DNJ) is more pronounced than that of the short alkylchain derivative N-butyl-DNJ (NB-DNJ), although the latter achieves a more effective ER α-glucosidase inhibition in cellulo. (See Durantel, D., et al., (2001) J. Virol. 75(19): 8987-98). In addition, long alkylchain DGJ-derivatives which are not recognized by and do not inhibit ER α-glucosidases, also show potent antiviral activity. Therefore, ER α-glucosidase inhibition does not directly correlate with the observed antiviral effect and is ruled out as the sole antiviral mechanism.

[0005] The additional mechanism of action is apparently associated with the length of the alkyl sidechain, as the shortchain N-butyl-DGJ (NB-DG.J) shows no antiviral activity, whereas the long alkylchain derivative NN-DGJ is a potent
inhibitor. It is, however, not associated with a detergent-like effect of the amphiphilic, alkylated iminosugar derivatives, as the structurally similar detergents n-octyl glucoside (n-OG) and n-nonyl glucoside are not antiviral in in vitro BVDV infectivity assays. (See Durantel, D., et al., (2001) J. Virol. 75(19): 8987-98). Drug treatment affects the dimerization of viral membrane glycoproteins and alters the membrane glycoprotein composition of secreted BVDV virions, but does not influence either viral RNA replication or protein synthesis.

arising from a ribosomal frameshift in the N-terminal region of the polyprotein. 

[0008] Because a cell culture model for HCV replication is unavailable, information about HCV replication is derived by using a BVDV cell culture model. As such, most functional data about p7 are derived from studying BVDV p7, a 70 amino acid protein very similar to HCV p7. Functional data about BVDV p7 has been obtained by introducing mutations into an infectious cDNA clone of BVDV. An in-frame deletion of the entire p7 gene does not affect BVDV RNA replication, but does lead to the production of non-infectious virions. However, infectious viral particles can be generated by complementing p7 in trans. (See Harada, T., N. Tautz, and H.J. Thiel, (2000) J. Virol. 74(20): 9498-506), which suggests that the pestivirus p7 is essential for the production of infectious progeny virus.

[0009] The HCV p7 protein is a 63 amino acid peptide which has been shown to be a polytopic membrane protein that crosses the membrane twice and has its N- and C-termini oriented towards the extracellular environment. (See Carrere-Kremer, S., et al., (2002) J. Virol. 76(8): 3720-30). As such, the p7 protein has been shown to include two transmembrane domains. The N-
terminal transmembrane domain includes amino acids from about position 10 to about position 32 and the C-terminal transmembrane domain includes amino acids from about position 36 to about position 58. Although the amino acids within the two transmembrane domains are somewhat variable among all HCV strains, for reported strains, a majority of amino acids within the transmembrane domains, (typically greater than about 70%), are members of a hydrophobic group characterized as F, I, W, Y, L, V, M, P, C, and A. The two transmembrane domains are linked by three non-hydrophobic amino acids, (K or R, G, R or K), and a consensus sequence for p7 is

SUMMARY

[0011] One embodiment relates to a method of treating HCV infection by administering iminosugar derivative compounds effective to inhibit the activity of HCV p7 protein in a subject in need thereof, particular a human. The compounds employed in the described method are effective at inhibiting the capability of HCV p7 protein to permeabilize membranes. In the broadest aspect, the compounds are represented by the following Formula I or II:

![Chemical Structures]

[0012] wherein each of $R^{11}$, $R^{11'}$, $R^{12}$, $R^{12'}$, $R^{13}$, $R^{13'}$, $R^{14}$, $R^{14'}$, $R^{15}$, $R^{15'}$, $R^{31}$, $R^{31'}$, $R^{32}$, $R^{32'}$, $R^{33}$, $R^{33'}$, $R^{34}$, and $R^{34'}$ is selected, independently from each other, from the group consisting of -H; -OH; -F; -Cl; -Br; -I; -NH$_2$; alkyl- and dialkylamino; linear or branched C$_{1-6}$ alkyl, C$_{2-6}$ alkenyl and alkynyl; aralkyl; linear or branched C$_{1-6}$ alkoxy; aryloxoy; aralkoxy; -(alkylene)oxy(alkyl); -CN; -NO$_2$; -COOH; -COO(alkyl); -COO(aryl); -C(O)NH(C$_{1-6}$ alkyl); -C(O)NH(aryl); sulfonyl; (C$_{1-6}$ alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C$_{1-6}$ alkyl)sulfamoyl; (C$_{1-6}$ alkyl)thio; (C$_{1-6}$ alkyl)sulfonamide; arylsulfonamide; -NHNH$_2$; -NHOH; aryl; and heteroaryl, wherein each of the substituents may be the same or different.

[0013] $R^2$ and $R^4$ are substituents selected independently of each other from the group consisting of linear C$_{7-18}$ alkyl, substituted C$_{1-18}$ alkyl, branched C$_{3-18}$ alkyl, C$_{2-18}$ alkenyl and alkynyl, and aralkyl. Each linear C$_{7-18}$ alkyl, branched C$_{3-18}$
alkyl, C_{2-18} alkenyl and alkynyl, and aralkyl optionally may be substituted, and the substituted C_{1-18} alkyl is substituted with one or more substituents independently selected from the group consisting of -OH; -F; -Cl; -Br; -I; -NH_{2}; alkyl- and dialkylamino; linear or branched C_{1-6} alkyl, C_{2-6} alkenyl and alkynyl; aralkyl; linear or branched C_{1-6} alkoxy, aryloxy; aralkoxy; -CN; -NO_{2}; -COOH; -COO(aryl); -COO(alkyl); -C(O)NH(C_{1-6} alkyl); -C(O)NH(aryl); sulfonyl; (C_{1-8} alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C_{1-6} alkyl)sulfamoyl; (C_{1-6} alkyl)thio; (C_{1-6} alkyl)sulfonamide; arylsulfonamide; -NHNH_{2}; and -NHOH, wherein selected substituents may be the same or different. Particularly suitable substituents include nonyl, 7-oxanonyl, and 10-oxaundecyl, and particularly desirable compounds include N-nonyldeoxylojirimycin (NNDNJ), N-nonyldeoxygalactonojirimycin (NNDGJ), N-7-oxanonyl-6-methyldeoxygalactonojirimycin (i.e., N-7-oxanonyl-6-deoxy-DGJ, N-7-oxanonyl-1,6-dideoxygalactonojirimycin, or N-7-oxanonyl-methyl-DGJ), and N-10-oxaundecyl-1,6-dideoxygalactonojirimycin (i.e., N-10-oxaundecyl-6-methyldeoxygalactonojirimycin, N-10-oxaundecyl-methyl-DGJ, N-10-oxaundecyl-6-deoxy-DGJ, (2R, 3S, 4R, 5S)-1-(9-methoxynonyl)-2-methyl-3,4,5-piperidinetriol, (2R, 3R)-2,3-dihydroxybutanedioate (1:1), or SP240).

[0014] One or more of the compounds may be packaged as a kit for treating HCV infection. The kit may include instructions for treating HCV infection as well as implements for administering the compounds.

[0015] Another embodiment relates to a method of screening compounds for the capability to inhibit HCV p7 activity. In particular, compounds may be screened based on whether the compound inhibits the capability of p7 or a
variant of p7 to permeabilize membranes. In such a method, it may be desirable to utilize an artificial membrane system or a bacterial system.

**BRIEF DESCRIPTION OF THE DRAWINGS**

[0016] **FIGURE** 1A shows the growth curves of *E. coli* Rosetta gami(DE3)pLacl cells. The optical densities (OD\textsubscript{600nm}) of non-transformed cells (A), cells transformed with pTriEx1.1 (B), and pTiEx1.1p7 (C) were monitored at the indicated times (hours post induction). Growth curves of uninduced cells (open circles) and cells induced by addition of 1mM IPTG (open squares) are shown. **FIGURE** 1B shows the release of [\textsuperscript{3}H]-uridine by non-transformed *E. coli* Rosetta gami(DE3)pLacl cells (A), cells transformed with pTriEx1.1 (B), and pHiEx1.1p7 (C) at the indicated times. Growth curves of un-induced cells (open circles) and cells induced by addition of 1mM IPTG (open squares) are shown.

[0017] **FIGURE** 2 shows a Tris-tricine gel electrophoresis analysis of synthetic HCV p7. The gel was silver-stained (left panel) or transferred to a membrane which was subsequently probed with streptavidin (right panel).

[0018] **FIGURE** 3A shows channel recordings of synthetic HCV p7 reconstituted into a BLM. Straight lines denote the closed state. **FIGURE** 3B shows a current trace recorded after approximately 30 minutes of data collection. **FIGURE** 3C shows a current histogram of the trace recorded at + 100 mV membrane potential as shown in **FIGURE** 3A.

[0019] **FIGURE** 4 shows the effect of the short (\textit{NB-DNJ}, \textit{NB-DGJ}) and long (\textit{NN-DNJ}, \textit{NN-DGJ}) alkylchain iminosugar derivatives on p7 channel signals in
BLM. The holding potential was held constant at +100 mV, and the iminosugar derivatives were added to a final concentration as indicated.

[0020] **Figure 5** shows the effect of \( N7 \)-oxanonyl-6-deoxy-DGJ (alternatively called \( N7 \)-oxanonyl-methyl-DGJ) on p7 channel signals in BLM. The holding potential was held constant at +100 mV, and \( N7 \)-oxanonyl-6-deoxy-DGJ was added to a final concentration as indicated.

[0021] **Figure 6** shows a graphical representation of the normalized, integrated current traces and standard deviation versus drug concentration. The data represent the average of three representative trace slices of 4 seconds for \( NN \)-DNJ (squares) and \( NN \)-DGJ (diamonds), and three representative trace slices of 30 seconds for \( N7 \)-oxanonyl-6-deoxy-DGJ (triangles). The approximate binding constants (\( K_{app} \)), as deduced by a sigmoidal fit of the data according to the formula “integrated current” = \( 1/(1 + ([\text{drug}] / K_{app})) \), are: for \( NN \)-DNJ, \( K_{app} = 45.2 \ (\pm \ 10.7) \ \mu M; \) for \( NN \)-DGJ, \( K_{app} = 110.4 \ (\pm \ 19.9) \ \mu M; \) and for \( N7 \)-oxanonyl-6-deoxy-DGJ, \( K_{app} = 114.2 \ (\pm \ 18.3) \ \mu M. \)

[0022] **Figure 7** shows the effect of SP240 (i.e., N-10-oxaundecyl-1,6-dideoxygalactonojirimycin) on p7 channel signals in BLM.

**Definitions**

[0023] Unless otherwise specified, the terms “a” or “an” mean “one or more.”
[0024] Unless otherwise specified, the term “alkyl” as used herein refers to straight- and branched-chain alkyl radicals containing one or more carbon atoms and includes, for example, methyl, ethyl, butyl, and nonyl.

[0025] The term “aryl” as used herein refers to a monocyclic aromatic group such as phenyl or a benzo-fused aromatic group such as indanyl, naphthyl, or fluorenyl and the like.

[0026] The term “heteroaryl” refers to aromatic compounds containing one or more hetero atoms. Examples include pyridyl, furyl, and thieryl or a benzofused aromatic containing one or more heteroatoms such as indolyl or quinolinyl.

[0027] The term “heteroatom” as used herein refers to non-carbon atoms such as N, O, and S.

[0028] The term “cycloalkyl” as used herein refers to a carbocyclic ring containing 3, 4, 5, 6, 7, or 8 carbons and includes, for example, cyclopropyl and cyclohexyl.

[0029] Unless otherwise specified, the term “alkoxy” as used herein refers to a straight- or branched-chain alkoxy containing one or more carbon atoms and includes, for example, methoxy and ethoxy.

[0030] The term “alkenyl” as used herein refers to a straight or branched-chain alkyl containing one or more double bonds such as ethenyl and propenyl.

[0031] The term “aralkyl” as used herein refers to an alkyl substituted with an aryl such as benzyl and phenethyl.

[0032] The term “alkynyl” as used herein refers to a straight or branched-chain alkyl containing one or more triple bonds such as ethynyl and propynyl.
[0033] The term "aryloxy" as used herein refers to a substituent created by replacing the hydrogen atom in an -OH group with an aryl group, and includes, for example, phenoxy.

[0034] The term "aralkoxy" as used herein refers to an alkoxy group substituted with an aryl group, such as 2-phenylethoxy.

[0035] The term "alkylamino" as used herein refers to an amino group substituted with one alkyl group such as methylamino (-NHCH₃) and ethylamino (-NHCH₂CH₃).

[0036] The term "dialkylamino" as used herein refers to an amino group substituted with two alkyl groups such as dimethylamino (-N(CH₃)₂) and diethylamino (-N(CH₂CH₃)₂).

[0037] The term "DNG" as used herein means 1,5-Dideoxy-1,5-imino-D-glucitol or "deoxynojirimycin."

[0038] The term "DGJ" as used herein means 1,5-Dideoxy-1,5-imino-D-galactitol or "deoxygalactonojirimycin."

[0039] The term "BLM" as used herein means "black lipid membranes."
DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0040] The compounds employed in the disclosed method are effective as inhibitors of HCV p7. In the broadest aspect, the compounds are represented by Formula I or II:

![Formula I and II](image)

[0041] In one aspect, the method contemplates administering compounds of Formula I. Each of $R^{11}$, $R^{11'}$, $R^{12}$, $R^{12'}$, $R^{13}$, $R^{13'}$, $R^{14}$, $R^{14'}$, $R^{15}$, and $R^{15'}$ is selected, independently from the other, from the group consisting of -H; -OH; -F; -Cl; -Br; -I; -NH$_2$; alkyl- and dialkylamino; linear or branched C$_{1-6}$ alkyl, C$_{2-6}$ alkenyl and alkynyl; aralkyl; linear or branched C$_{1-6}$ alkoxy; aryloxy; aralkoxy; -(alkylene)oxy(alkyl); -CN; -NO$_2$; -COOH; -COO(alkyl); -COO(aryl); -C(O)NH(C$_{1-6}$ alkyl); -C(O)NH(aryl); sulfonyl; (C$_{1-6}$ alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C$_{1-6}$ alkyl)sulfamoyl; (C$_{1-6}$ alkyl)thio; (C$_{1-6}$ alkyl)sulfonamido; arylsulfonamide; NNNH$_2$; -NHOH; aryl; and heteroaryl. Each substituent may be the same or different.

[0042] In a preferred embodiment, at least one of $R^{11}$, $R^{11'}$, $R^{12}$, $R^{12'}$, $R^{13}$, $R^{13'}$, $R^{14}$, $R^{14'}$, $R^{15}$, and $R^{15'}$ is a hydroxymethyl group (-CH$_2$OH). Alternatively, at least one of $R^{11}$, $R^{11'}$, $R^{12}$, $R^{12'}$, $R^{13}$, $R^{13'}$, $R^{14}$, $R^{14'}$, $R^{15}$, and $R^{15'}$ is a hydroxy group (-OH). The most preferred embodiment contemplates at least two of
R^{11}, R^{11'}, R^{12}, R^{12'}, R^{13}, R^{13'}, R^{14}, R^{14'}, R^{15}, and R^{15'} being selected from -CH_{3}, -CH_{2}OH, and -OH.

[0043] R^{2} is a substituent selected from linear C_{7-18} alkyl, substituted C_{1-18} alkyl, branched C_{3-18} alkyl, C_{2-18} alkenyl and alkynyl, and aralkyl. Each linear C_{7-18} alkyl, branched C_{3-18} alkyl, C_{2-18} alkenyl and alkynyl, and aralkyl optionally may be substituted, and the substituted C_{1-18} alkyl is substituted with one or more groups independently selected from -OH; -F; -Cl; -Br; -I; -NH_{2}; alkyl- and dialkylamino; linear or branched C_{1-6} alkyl, C_{2-6} alkenyl and alkynyl; aralkyl; linear or branched C_{1-6} alkoxy, aryloxy; aralkoxy; -CN; -NO_{2}; -COOH; -COO(alkyl); -COO(aryl); -C(O)NH(C_{1-6} alkyl); -C(O)NH(aryl); sulfonyl; (C_{1-6} alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C_{1-6} alkyl)sulfamoyl; (C_{1-6} alkyl)thio; (C_{1-6} alkyl)sulfonamide; arylsulfonamide; -NHNH_{2}; and -NHOH.

[0044] Preferably, R^{2} is a linear C_{7-18} alkyl, branched C_{3-18} alkyl, or substituted C_{1-18} alkyl group. More preferably, R^{2} is a linear C_{7-11} alkyl, branched C_{7-11} alkyl, substituted C_{7-11} alkyl, or linear or branched C_{1-18} alkyl substituted with a C_{1-6} alkoxy. Examples of R^{2} that are linear C_{7-11} alkyl substituents include heptyl, octyl, and nonyl. An example of R^{2} being a substituted alkyl group is 7-oxanonyl (-CH_{2}(CH_{2})_{5}-O-CH_{2}CH_{3}). Most preferably, R^{2} is n-nonyl, 7-oxanonyl, or 10-oxaundecyl.

[0045] In certain embodiments of Formula I, the compound may be
represented as one of the following formulas:
The stereochemistry at each ring carbon atom in the formulas above may vary independently from that in the other ring carbon atoms. More preferably, the compound has one of the formulas as set forth in Table I:

N-10-oxaundecyl-6-MeDGJ
Another aspect of the disclosed method contemplates administering compounds of Formula II. Each of $R^{31}$, $R^{31'}$, $R^{32}$, $R^{32'}$, $R^{33}$, $R^{33'}$, $R^{34}$, and $R^{34'}$ is selected, independently from the other, from the group consisting of -H; -OH; -F; -Cl; -Br; -I; -NH$_2$; alkyl- and dialkylamino; linear or branched C$_{1-6}$ alky1, C$_{2-6}$ alkenyl and alkynyl; aralkyl; linear or branched C$_{1-6}$ alkoxy; aryloxy; aralkoxy; -(alkylene)oxy(alkyl); -CN; -NO$_2$; -COOH; -COO(alkyl); -COO(aryl); -C(O)NH(C$_{1-6}$ alkyl); -C(O)NH(aryl); sulfonyl; (C$_{1-6}$ alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C$_{1-6}$ alkyl)sulfamoyl; (C$_{1-6}$ alkyl)thio; (C$_{1-6}$ alkyl)sulfonamide; arylsulfonamide; -NHNH$_2$; -NHOH; aryl; and heteroaryl. Each substituent may be the same or different.

In a preferred embodiment, at least one of $R^{31}$, $R^{31'}$, $R^{32}$, $R^{32'}$, $R^{33}$, $R^{33'}$, $R^{34}$, and $R^{34'}$ is a hydroxymethyl group (-CH$_2$OH). Alternatively, at least one of $R^{11}$, $R^{11'}$, $R^{12}$, $R^{12'}$, $R^{13}$, $R^{13'}$, $R^{14}$, $R^{14'}$, $R^{15}$, and $R^{15'}$ is a hydroxy group (-OH). The most preferred embodiment contemplates at least two of $R^{11}$, $R^{11'}$, $R^{12}$, $R^{12'}$, $R^{13}$, $R^{13'}$, $R^{14}$, $R^{14'}$, $R^{15}$, and $R^{15'}$ being selected from -CH$_3$, -CH$_2$OH, and -OH.

In Formula II, $R^4$ is a substituent selected from linear C$_{7-18}$ alkyl, substituted C$_{1-18}$ alkyl, branched C$_{3-18}$ alkyl, C$_{2-18}$ alkenyl and alkynyl, and aralkyl. Each linear C$_{7-18}$ alkyl, branched C$_{3-18}$ alkyl, C$_{2-18}$ alkenyl and alkynyl, and aralkyl optionally may be substituted, and each substituted C$_{1-18}$ alkyl is substituted with one or more groups independently selected from -OH; -F; -Cl; -Br; -I; -NH$_2$; alkyl- and dialkylamino; linear or branched C$_{1-6}$ alky1, C$_{2-6}$ alkenyl and alkynyl; aralkyl; linear or branched C$_{1-6}$ alkoxy, aryloxy; aralkoxy; -CN; -
NO₂; -COOH; -COO(alkyl); -COO(aryl); -C(O)NH(C₁₋₈ alkyl); -C(O)NH(aryl);
sulfonyl; (C₁₋₆ alkyl)sulfonyl; arylsulfonyl; sulfamoyl; (C₁₋₆ alkyl)sulfamoyl; (C₁₋₈
alkyl)thio; (C₁₋₆ alkyl)sulfonamide; arylsulfonamide; -NHNH₂; and -NHOH.

[0052] Preferably, R⁴ is a linear C₇₋₁₈ alkyl, branched C₃₋₁₈ alkyl, or
substituted C₁₋₁₈ alkyl group. More preferably, R⁴ is a linear C₂₋₁₁ alkyl,
branched C₂₋₁₁ alkyl, substituted C₂₋₁₁ alkyl, or linear or branched C₁₋₁₈ alkyl
substituted with a C₁₋₆ alkoxy. Examples of R⁴ that are linear C₂₋₁₁ alkyl
substituents include heptyl, octyl, and nonyl. An example of R⁴ being a
substituted alkyl group is 7-oxanononyl (-CH₂(CH₂)₅-O-CH₂CH₃). Most preferably,
R⁴ is n-nonyl, 7-oxanononyl, or 10-undecyl.

[0053] In one embodiment, disclosed is a method for treating an HCV
infection that includes contacting either the HCV p7 protein or components of
a membrane that includes the p7 protein with one or more compounds that
inhibit the activity of the p7 protein. The inventors have shown that the p7
protein increases the permeability of membranes, likely by functioning as a
membrane channel protein. In addition, the inventors have shown that
particular compounds can inhibit the ability of p7 to permeabilize membranes.
However, the disclosed method contemplates that the compounds disclosed
herein may inhibit other activities of p7 protein as well.

[0054] The selected compound may inhibit one or more activities of the p7
protein by interacting with the protein. In this instance, it may be desirable to
select a compound that binds the p7 protein with an apparent binding constant
of no more than about Kₐₚp = 130 μM (i.e., Kₐₚp = 114.2 (± 18.3) μM), as
shown in particular binding assays. Alternatively, it may be desirable to select
a compound that blocks the ability of p7 protein to permeabilize membranes when the compound is present at a concentration of no more than about 180 μM, as shown in particular permeability assays.

[0055] Where the selected compound inhibits the capability of p7 to permeabilize membranes, the compound may prevent p7 from forming channels, or the compound may block the channel after it has formed, (i.e., as a channel blocker). Alternatively, the compound may inhibit the p7 protein by interacting with one or more components of the membrane, such as phospholipids, thereby changing the membrane’s fluidity or local characteristics. As such, the compound may inhibit the capability of p7 to form functional membrane channels.

[0056] In yet another embodiment, a method is provided for screening for a potential antiviral agent effective to inhibit activity of HCV p7. Typically, the method comprises incorporating p7 or a variant of p7 into a membrane system and observing an increase in permeability, e.g., by recording electrical currents through the membrane using standard methods. Test compounds are then added to the membrane system to determine whether the compound inhibits the ability of p7 to permeabilize membranes. Ideal compounds may completely block the ability of p7 to permeabilize membranes at concentrations of no more than about 180 μM.

[0057] Black lipid membranes ("BLM") may be used in the method, but other membrane systems may be utilized as well. Black lipid membranes are well known in the art, and BLM are commonly used to study membrane

[0058] After a suitable membrane system for observing p7 activity has been selected, p7 may be incorporated into the membranes to form p7-containing membranes. The p7 protein may be selected from any HCV strain where the p7 protein can be shown to increase the permeability of a selected membrane. For example, the p7 protein from the HCV-H strain may be selected (i.e., ALENLVILNAASLAGTHGLVSLVFFCFAWVLGRVPGLYALGMWPPPLLPMA LPQRAYA (SEQ ID NO.: 1)), or the p7 protein from another strain may be selected. It may be desirable to use a p7 consensus sequence, obtained by comparing the amino acid sequences of reported p7 proteins, or it may be desirable to select a p7 protein from a particular HCV clade, (e.g., clade 1).

[0059] In another embodiment of the screening method, it may be desirable to use a variant of the selected p7 protein, provided that the variant is functional (e.g., the variant may be shown to permeabilize a chosen membrane as determined by methods known in the art). Possible variants include fusions, deletions, and/or mutations or substitutions. For example, it may be desirable to create a biotinylated p7 protein for use in the described method. In another example, it may be desirable to use at least those portions of p7 or a derivative of p7 that can be shown to permeabilize a chosen membrane (e.g., a selected p7 protein or variant may demonstrate a conductance level in a BLM of no less than about 60 pS (i.e., 86 ± 22 pS)). It also may be desirable to create mutations within a selected p7 amino acid sequence. Where mutations are created, it may be desirable to maintain the defining characteristic of the amino
acid at a given position based on comparisons between HCV strains. For example, a comparison of the p7 sequences from different HCV strains has shown that certain amino acid positions may be characterized as "hydrophobic," "neutral," or "hydrophilic." (See Carrere-Kremer, S., et al., (2002) J. Virol. 76(8): 3720-30). A "hydrophobic amino acid" may be characterized as belonging to the group F, I, W, Y, L, V, M, P, C, and A.

[0060] The chosen p7 protein or variant may be synthesized artificially or expressed in a suitable biological system, such as bacterial or eukaryotic cells. After the protein has been incorporated into the selected membrane system, the permeability of the membranes may be measured to determine whether the protein demonstrates activity (e.g., causing an increase in permeability or a decrease in cell viability). Test compounds may be contacted with the protein and/or components of the p7-containing membranes to determine whether the compounds inhibit the activity of the protein. In the described method, the test compounds may be contacted with p7 and/or the components of the p7-containing membranes before and/or after p7 has been incorporated into the membranes.

[0061] In one embodiment, it may be desirable to use iminosugar derivatives as test compounds in the screening method. In particular, it may be desirable to use alkylated derivatives of DGJ or DNJ as described herein as test compounds. Derivatives of the alkylated imino sugars N-nonyldeoxyojirimycin (NN-DNJ), N-nonyldeoxygalactonojirimycin (NN-DGJ), N-7-oxanonyl-6-methyldeoxygalactonojirimycin (i.e., N-7-oxanonyl-6-deoxy-DGJ, N-7-oxanonyl-1,6-dideoxygalactonojirimycin, or N-7-oxanonyl-methyl-DGJ), and N-10-
oxaundecyl-1,6-dideoxygalactonojirimycin (i.e., N-10-oxaundecyl-6-
methyldideoxygalactonojirimycin, N-10-oxaundecyl-methyl-DGJ, N-10-oxaundecyl-
6-deoxy-DGJ, (2R, 3S, 4R, 5S)-1-(9-methoxynonyl)-2-methyl-3,4,5-
piperidinetriol, (2R, 3R)-2,3-dihydroxybutanedioate (1:1), or SP240) and/or
their isomers may be particularly desirable.

[0062] In another embodiment, it may be desirable to use compounds or
derivatives thereof that have been shown to interact with p7 or other
membrane components as test compounds in the method (e.g., compounds
that have been shown to interact with p7 in vitro). In yet another
embodiment, it may be desirable to use compounds that have been shown to
disrupt channel formation either by p7 or other proteins, and/or compounds
that are known blockers of channels formed by p7 or other proteins, or
derivatives thereof, as test compounds in the method. For example,
amantadine is a known channel blocker of influenza A virus M2 channels. (See
30(6): p. 416-20). Recently, others have suggested that p7 forms an ion
channel that is blocked by amantadine. (See Griffin et al., FEBS Letters, 2003,
Jan. 20; 535(1-3):34-8). As such, it may be desirable to use amantadine or
derivatives thereof as test compounds in the method.

[0063] In one embodiment, an inducible bacterial system may be utilized to
observe permeability, where an increase in the permeability of the bacterial cell
membranes may lead to an arrest in cell growth. For example, p7 or a variant
thereof may be expressed from an inducible promoter in a suitable bacteria system to determine if the cells display an arrest in cell growth. Alternatively, an increase in permeability can be verified by labeling the cells with a radioactive molecule such as $[^3$H]-uridine prior to induction of p7 expression. After induction of p7 expression, permeability can be assessed by measuring the release of $[^3$H]-uridine into the media. Test compounds may be administered to the bacteria to determine whether the compounds prevent cell growth arrest and/or whether the compounds prevent release of $[^3$H]-uridine into the media.

**Preparation of the Compounds**

[0064] Compounds for use in the methods described herein may be prepared from commercially available imino compounds used as starting materials. Commercial sources include Sigma, St. Louis, MO; Cambridge Research Biochemicals, Norwich, Cheshire, United Kingdom; and Toronto Research Chemicals, Ontario, Canada.

[0065] Alternatively, the present compounds can be prepared by synthetic methods known to those skilled in the art. For example, the syntheses of a variety of deoxyojirimycin (DNJ) derivatives are described in U.S. Patent Nos. 5,622,972; 5,200,523; 5,043,273; 4,944,572; 4,246,345; 4,266,025; 4,405,714; and 4,806,650 and in U.S. Application Serial No. 10/031,145. Other imino sugar compounds described herein are known and may be prepared by methods set forth in U.S. Pat. Nos. 4,861,892; 4,894,388;
4,910,310; 4,996,329; 5,011,929; 5,013,842; 5,017,704; 5,580,884;
5,286,877; 5,100,797; and 6,291,657.

Pharmaceutical Compositions

[0066] Where it is desirable to administer the compounds as a
pharmaceutical composition or medicament, the compounds disclosed herein
can be formulated for a variety of modes of administration. Techniques and
formulations generally may be found in REMINGTON’S PHARMACEUTICAL SCIENCES

[0067] The medicaments may be adapted for administration by any
appropriate route, for example by the oral (including buccal or sublingual),
rectal, nasal, topical (including buccal, sublingual or transdermal), or parenteral
(including subcutaneous, intramuscular, intravenous or intradermal) route
although oral administration is preferred. Such a composition may be prepared
by any method known in the art of pharmacy, for example by admixing the
active ingredient with a carrier under sterile conditions.

[0068] Pharmaceutically acceptable salts are generally well known to those
of ordinary skill in the art, and may include, by way of example but not
limitation, acetate, benzenesulfonate, besylate, benzoate, bicarbonate,
bitartrate, bromide, calcium edetate, camsylate, carbonate, citrate, edetate,
edisylate, estolate, esylate, fumarate, gluceptate, gluconate, glutamate,
glycollylarsanilate, hexylresorcinate, hydrabamine, hydrobromide,
hydrochloride, hydroxynaphthoate, iodide, isethionate, lactate, lactobionate,
malate, maleate, mandelate, mesylate, mucate, napsylate, nitrate, pamoate (embonate), pantothenate, phosphate/disphosphate, polygalacturonate, salicylate, stearate, subacetate, succinate, sulfate, tannate, tartrate, or teoclate. Other pharmaceutically acceptable salts may be found, for example, in Remington's Pharmaceutical Sciences (18th ed.), supra.

[0069] Preferred pharmaceutically acceptable salts include, for example, acetate, benzoate, bromide, carbonate, citrate, gluconate, hydrobromide, hydrochloride, maleate, mesylate, napsylate, pamoate (embonate), phosphate, salicylate, succinate, sulfate, or tartrate.

[0070] For injection, the compounds and agents may be formulated in aqueous solutions, preferably in physiologically compatible buffers such as Hank’s solution, Ringer’s solution, or physiological saline buffer. For such transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art.

[0071] Use of pharmaceutically acceptable carriers to formulate the compounds herein disclosed for the practice of the methods into dosages suitable for systemic administration is within the scope of the methods. With proper choice of carrier and suitable manufacturing practice, the compositions of the present methods, in particular, those formulated as solutions, may be administered parenterally, such as by intravenous injection. The compounds can be formulated readily using pharmaceutically acceptable carriers well known in the art into dosages suitable for oral administration. Such carriers enable the compounds of the methods to be formulated as tablets, pills,
capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated.

[0072] Pharmaceutical compositions suitable for use in the present methods include compositions wherein the active ingredients are contained in an effective amount to achieve its intended purpose. Determination of the effective amounts is well within the capability of those skilled in the art, especially in light of the detailed disclosure provided herein.

[0073] In addition to the active ingredients, these pharmaceutical compositions may contain suitable pharmaceutically acceptable carriers comprising excipients and auxiliaries which facilitate processing of the active compounds into preparations which can be used pharmaceutically. The preparations formulated for oral administration may be in the form of tablets, dragees, capsules, or solutions.

[0074] The medicaments described herein and which are also for use in the methods provided herein, may include one or more of the following: preserving agents, solubilizing agents, stabilizing agents, wetting agents, emulsifiers, sweeteners, colorants, odorants, salts, buffers, coating agents or antioxidants. They may also contain therapeutically active agents in addition to the compounds and/or agents described herein. Pharmaceutical preparations for oral use can be obtained by combining the active compounds with solid excipients, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients are, in particular, fillers such as sugars, including lactose, sucrose, mannitol, or sorbitol; cellulose preparations, for
example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum
tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium
carboxymethyl-cellulose (CMC), and/or polyvinylpyrrolidone (PVP: povidone). If
desired, disintegrating agents may be added, such as the cross-linked
polyvinylpyrrolidone, agar, or alginic acid or a salt thereof such as sodium
alginate.

[0075] Pharmaceutical preparations which can be used orally include push-fit
capsules made of gelatin, as well as soft, sealed capsules made of gelatin, and
a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the
active ingredients in admixture with filler such as lactose, binders such as
starches, and/or lubricants such as talc or magnesium stearate and, optionally,
stabilizers. In soft capsules, the active compounds may be dissolved or
suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid
polyethylene glycols (PEGs). In addition, stabilizers may be added.

Routes of Administration

[0076] Various routes of administration will now be considered in greater
detail:

a. Oral Administration

[0077] Medicaments adapted for oral administration may be provided as
capsules or tablets; as powders or granules; as solutions, syrups or
suspensions (in aqueous or non-aqueous liquids); as edible foams or whips; or
as emulsions.
[0078] Tablets or hard gelatin capsules may comprise lactose, maize starch or derivatives thereof, stearic acid or salts thereof.

[0079] Soft gelatin capsules may comprise vegetable oils, waxes, fats, semi-solid, or liquid polyols etc.

[0080] Solutions and syrups may comprise water, polyols and sugars. For the preparation of suspensions oils (e.g., vegetable oils) may be used to provide oil-in-water or water-in-oil suspensions.

b. Transdermal Administration

[0081] Medicaments adapted for transdermal administration may be provided as discrete patches intended to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. For example, the active ingredient may be delivered from the patch by iontophoresis (iontophoresis is described in *Pharmaceutical Research*, 3(6):318 (1986)).

c. Topical Administration

[0082] Medicaments adapted for topical administration may be provided as ointments, creams, suspensions lotions, powders, solutions, pastes, gels, sprays, aerosols or oils.

[0083] For infections of the eye or other external tissues, for example mouth and skin, a topical ointment or cream is preferably used. When formulated in an ointment, the active ingredient may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredient may be formulated in a cream with an oil-in-water base or a water-in-oil base.
Medicaments adapted for topical administration to the eye include eye drops. Here the active ingredient can be dissolved or suspended in a suitable carrier, e.g., in an aqueous solvent.

Medicaments adapted for topical administration in the mouth include lozenges, pastilles and mouthwashes.

d. Rectal Administration

Medicaments adapted for rectal administration may be provided as suppositories or enemas.

e. Nasal Administration

Medicaments adapted for nasal administration which use solid carriers include a coarse powder (e.g., having a particle size in the range of 20 to 500 microns). This can be administered in the manner in which snuff is taken, i.e., by rapid inhalation through the nose from a container of powder held close to the nose.

Compositions adopted for nasal administration which use liquid carriers include nasal sprays or nasal drops. These may comprise aqueous or oil solutions of the active ingredient.

Medicaments adapted for administration by inhalation include fine particle dusts or mists, which may be generated by means of various types of apparatus, e.g., pressurized aerosols, nebulizers or insufflators. Such apparatus can be constructed so as to provide predetermined dosages of the active ingredient.
f. Parenteral Administration

Medicaments adapted for parenteral administration include aqueous and non-aqueous sterile injectable solutions or suspensions. These may contain antioxidants, buffers, bacteriostats and solutes which render the compositions substantially isotonic with the blood of an intended recipient. Other components which may be present in such compositions include water, alcohols, polyols, glycerine and vegetable oils, for example. Compositions adapted for parenteral administration may be presented in unit-dose or multidose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of a sterile liquid carrier, e.g., sterile water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets.

g. Dosages

Dosages will be readily determinable by routine trials, and will be under the control of the physician or clinician. The guiding principle for determining a suitable dose will be delivery of a suitably efficacious but nontoxic, or acceptably toxic, amount of material. (See e.g., Fingl et al., (1975) The Pharmacological Basis of Therapeutics, Ch. 1 p. 1). For NN-DNJ or a similar compound, a daily dosage for an adult could be expected to be in the range of from 0.1 mg to 5 g of active agent, and may be in the range of from 3 to 2400 mg, preferably 5 to 800 mg, more preferably 15 to 400 mg, and
most preferably 15 to 100 mg. The dosage may be administered in a single
daily dose or alternatively in two, three or more doses during the day.
The following examples are proffered merely to illustrate the methods described above; they are not intended to limit in any way the scope of the inventions described herein.

EXAMPLE 1. Inducible p7 expression in bacteria.

The following set of experiments demonstrate that p7 can be inducibly expressed in bacteria. The experiments may be utilized to determine whether p7 or variants of p7 are capable of permeabilizing membranes. The experiments also show that p7 expression effects a cessation in cell growth, and further, p7 expression effects a release in radioactively labeled uridine.

Example 1.1. Materials and Methods.

Construction of p7 expression plasmids. Standard cloning procedures were used for construction of the recombinant plasmids by DNA manipulations. The coding region of HCV p7 was amplified by polymerase chain reaction (PCR) using as a template the plasmid pTM1/CE1E2p7 encoding HCV 1a strain cDNA (AF009606), kindly provided by J. Dubuisson. PCR reactions were performed using two oligonucleotide primers: 1,

AAGCGCCCATGGCTTTTGGAACACCTCGTAATAC (SEQ ID NO.: 2) and 2,

ATTGAATTCCTTAGTGGATGGTGGATGGTGGAGGAC (SEQ ID NO.: 3). Primers 1 and 2 encode the 5' and 3' terminal region of p7, respectively. To create an Ncol restriction site at the 5' end and an EcoRI restriction site at the 3' end, the underlined sequences were introduced into
the primers. The resulting PCR product was purified, digested with Ncol and EcoRI restriction enzymes (Roche), and ligated with pTriEx1.1 expression vector (Novagen), which had been previously digested with Ncol and EcoRI. The ligation mixture was used to transform competent *E. coli* R. gami (DE3)pLacl cells (CN Biosciences). A bacterial clone containing the recombinant plasmid was amplified in 50μg/ml carbenicillin (Sigma) containing medium. The plasmid DNA was isolated, subjected to restriction analysis, and sequenced using a primer for the T7 promoter and primer 2, in order to exclude the possibility that mutations had been introduced during the PCR reaction. The isolated p7-containing plasmid was designated pTriEx1.1p7.

**[0095]** *Induction of p7 expression in bacteria.* Single colonies of *E. coli* R.gami (DE3)pLacl cells containing either pTriEx1.1 or pTriEx1.1p7 plasmids were grown in LB medium in the presence of 50μg/ml carbenicillin by shaking them at 37°C, until they reached an OD<sub>600nm</sub> of 0.5. Three ml of these starter cultures were added to 100 ml of LB medium containing 50μg/ml carbenicillin and 0.4% glucose, and cells were grown under the same conditions. When the cells reached an OD<sub>600nm</sub> of 0.5-0.7, p7 expression was induced by the addition of 1mM isopropylthiogalactopyranoside (IPTG) (Roche) and their further growth was followed by monitoring the OD<sub>600nm</sub>. Untransformed bacteria (without pTriEx1.1 plasmid) were grown in the absence of carbenicillin.
Release of [3H]-uridine from bacterial cells. Bacteria were grown as described above, but this time in the presence of 2μCi/ml of [3H]-uridine (Amersham, UK) until they reached an OD600nm of 0.5. The cells were then pelleted, washed three times with PBS, and resuspended in 25 ml of growth medium. Fifteen minutes later, p7 expression was induced by the addition of 1 mM IPTG. At various post-induction times, 0.5 ml aliquots were removed, the cells were pelleted by centrifugation, the supernatants were mixed with 3.5 ml of Ultima Gold scintillation cocktail (Packard, UK), and the radioactivity released into the medium was quantified by scintillation counting, using a Beckman LS 3801 scintillation counter.

Example 1.1. Results.

(Figure 1A, top panel) and cells transformed with pTriEx1.1 (Figure 1B, top panel), whereas expression of p7 led to an arrest of cell population growth (Figure 1C, top panel), most likely due to pore formation in the E. coli cell membranes.

To analyze the efflux of compounds from bacteria expressing HCV p7, recombinant clones were loaded with radioactively labeled uridine, and the release of radioactivity was measured at different time points after induction (Figure 1, bottom panel). No significant efflux of [³H]-uridine was observed with non-transformed cells or clones carrying the parental plasmid (Figure 1A and B, bottom panel). Cells expressing p7 started to release [³H]-uridine into the medium 2 hours after induction of p7 synthesis. Release of [³H]-uridine increased during the 4 hour monitoring period (Figure 1C), indicating a p7 induced permeability of outer cell membranes.

EXAMPLE 2. Incorporation of synthesized p7 into BLM.

The following sets of experiments demonstrate that synthesized p7 can increase the permeability of BLM as measured by channel recordings. The experiments also show that long alkyl chain iminosugar derivatives inhibit p7 activity.

Example 2.1. Materials and Methods.

Peptide synthesis and product quality control. Fifty mg of the peptide corresponding to p7 (HCV H strain) with a biotin-tag added at the N-
terminus, (biotin-ALENVILNAASLAGTHGLVSFLVFFCFAWYLKGRWVPGAVYALYYGMWPLLPLLALLaLPQRAYA (SEQ ID NO.: 4)), was synthesized by Albachem, UK. The p7 peptide was analyzed using matrix-assisted laser desorption ionization mass spectrometry (MALDI-MS): The p7 protein was dissolved in 40% acetonitrile to give a solution containing 1 mg/ml peptide. A 1µl aliquot of this solution was mixed with 1µl of a solution of a saturated α-cyano-4-hydroxy cinnamic acid in 95:5 acetonitrile/water (v/v) containing 16 mM octyl-glucoside solution. An aliquot (1µl) of this mixture was placed on the mass spectrometer target and allowed to air dry. The detected masses were externally calibrated using a trypsin autodigest. Mass spectra were recorded using a TofSpec 2E mass spectrometer (Micromass, Wythenshawe, Manchester, UK) operating in reflectron mode. The source, extraction, and focusing voltages were 20000, 19950 and 16000V, respectively. All data were analyzed using Mass Lynx version 3.2 software. Following MALDI mass spectrometry analysis, a peak corresponding to the full-length p7 peptide was observed, i.e., at m/z 7247.8.

[0101] To measure the purity of the full length peptide, the peptide was further submitted to Tris-Tricine gel electrophoresis, using a modified version of the method developed by Schägger and von Jagow, (1987) *Anal. Biochem.*, 166(2): p. 368-79. Briefly, p7 (5 µg) dissolved in 40% acetonitrile/water (500 µg/ml) was applied in Tricine sample buffer to a gel (8 x 10 cm²) consisting of a separating gel (20.18% T, 0.83% C), a spacer gel (11.44% T, 0.34% C), and a stacking gel (10.9% T, 0.32% C), with T being the total percentage concentration of both monomers (acrylamide and bisacrylamide) and C being
the percentage concentration of the crosslinker relative to T. The gel was run
at a constant voltage of 30V until the sample had completely entered the
stacking gel, after which the voltage was increased to 110V.

[0102] The gels were analyzed by both silver-staining and Western-blotting.
For silver-staining, the gel was washed for 10 min in 50% methanol and for 10
minutes in 5% methanol. The gel was then incubated for 10 min in a 40 μM
DTT solution, before it was rinsed with water and incubated in a 0.1% AgNO₃
aqueous solution for 10 minutes. It was subsequently washed three times for
10 seconds with water, before the developing solution (7.5 g NaCO₃, 125 μl
formaldehyde in 250 ml water) was added. The developing process was
stopped by the addition of solid citric acid monohydrate. The gel was rinsed
with water and soaked in 35% ethanol/2% glycerol before drying.

[0103] For Western blot analysis the protein from the gel was transferred in
transfer buffer (24 mM Tris base, 192 mM glycine, 20% methanol) to an
Immobilon P membrane (Amersham, UK) using a semi-dry electroblotter (2
hours at 40 mA) (Merck). The membrane was blocked overnight in PBS-0.1%
Tween containing 3% milk and incubated with horseradish peroxidase-coupled
streptavidin (1 μg/ml in PBS-0.1% Tween, 1% milk) for 3 hours at room
temperature. It was then washed twice in PBS-0.1% Tween, 1% milk and
developed using the ECL detection system (Amersham, UK) following the
manufacturer’s instructions.

[0104] Both the silver-stained gel and the Western-blot revealed one major
species of the expected molecular weight (Figure 2), indicating that at least a
portion of the loaded protein contained the full-length, biotinylated p7 protein.
However, because differences in resolution between gels with and without urea have been observed before, the chemically synthesized p7 was re-analyzed in the absence of urea. While the streptavidin-probed Western blot revealed the presence of full-length biotinylated p7, an additional broad band of around half the apparent molecular weight was observed on silver-stained gels, which constituted between 50 and 60% of total p7. This broad band may correspond to the smaller non-biotinylated p7 derived species observed by mass spectroscopy, the masses of which theoretically correspond to fragments of p7 containing the N-terminal transmembrane domain. Because the separation of full-length p7 from truncated forms of p7 proved to be difficult, the mixture was subsequently used for channel recordings in black lipid membranes.

[0105] Channel recordings in black lipid membranes (BLM). The formation of BLM to study membrane dynamics is well known in the art. A BLM was formed across an elliptical aperture of approximately 100 μm diameter on the long axis in a thin teflon film (with a thickness of approximately 25 μm, Yellow Springs Instruments, Ohio, USA). (See Montal, M. and P. Mueller, (1972) Proc. Natl. Acad. Sci. USA 69(12): p. 3561-6. Forty μl of a mixture of lipids (1-palmitoyl-2-oleoyl-sn-glycero-3-phosphoethanolamine (POPE):1-palmitoyl-2-oleoyl-sn-glycero-3-phosphocholine (POPC)(4:1 (w/w)) were dissolved in pentane (5mg/ml) and spread on top of an aqueous subphase (0.5 M KCl, 5 mM HEPES, 1 mM CaCl₂, pH 7.4). This resulted in approximately 0.2 mg of lipid being deposited on each side of the thin teflon film. After a time period of
10 minutes for the solvent to evaporate, the BLM was formed by raising the 
buffer level in the chambers above the hole in the teflon film. After formation 
of a stable BLM the HCV p7 protein (dissolved in ethanol) was added from a 
200-fold excess stock solution to the aqueous subphase (volume in each 
chamber on both sides of the bilayer: 2 ml) of the electrically grounded, trans 
side chamber to reach a final concentration of approximately 50 μM. 
Recordings appeared after a time delay of approximately 10 minutes. Electrical 
currents were recorded with an Axopatch 1D amplifier at a rate of 5 kHz. Data 
were filtered using a cut off frequency of 50 Hz and further analyzed using the 
software Origin 5.0. Drugs (from 10 mM stock solutions of NN-DNJ (Synergy 
Pharmaceuticals), NN-DGJ (Toronto Research Chemicals) and N7-oxyanonyl-6- 
deoxy-DGJ (United Therapeutics Inc.), and from 100 mM stock solutions of 
NB-DNJ (Sigma) and NB-DGJ were added on either the cis or trans side. 
Increasing drug concentrations were achieved by sequential addition of 
equivalent volumes to the measurement chamber. Data was recorded 
approximately 1 minute after addition of drug for about 3 minutes at +100 
mV.

Example 2.2. Results.

[0106] Incorporation of p7 into BLM. Adding p7 to the buffer chamber 
increases the permeability of BLM, as determined by recording channel signals 
across the BLM. The channels had a conductance level of up to 2 nS at −100
mV (Figure 3A). The smallest mean conductance level detected was around 86 ± 22 pS at +50 mV (Table 1).

Table 1: Conductance levels of p7. Data are derived from the recordings in Fig. 3A and presented as the mean value ± the standard error of the mean, as shown in brackets. The mean was calculated from 1 second slices of the recordings.

*averaged values from a single section of 1 second with standard deviation

**value as determined from visible inspection of the traces
The lifetime of defined conductance levels ranges from hundreds of milliseconds to several seconds. Stable long lasting conductance states differ by about 100 pS (and multiples of it), suggesting the formation of a fairly stable channel with a conductance of around 100 pS. Fluctuation in the recording may indicate the presence of sub-conductance states. An example histogram of recordings taken at +100 mV is shown in Fig 3B. Prolonged measurements with the same sample result in increasing noise levels, which eventually rule out the assignment of defined conductance levels (Figure 3C). In some experiments, insertion of p7 into the BLM results in burst-like activity (e.g., Figure 4, top left panel).

Streptavidin gold staining of membranes that contain biotin-p7 protein and subsequent detection of the complex by transmission electronmicroscopy indicates that the biotin-p7 proteins look like a channel, (data not shown), as reported for biosynthetically-synthesized HCV p7. (See Griffin et al., FEBS Letters, 2003, Jan. 20; 535(1-3):34-8). (See also Pavlovic et al., PNAS 2003, May 13;100(10):6104-8).

Neither a peptide including transmembrane domain I ("TMD I"),(e.g., ALENLVILNAASLAGTHGLVSFLVFFCFAWYLK (SEQ ID NO.: 5)), nor a peptide including transmembrane domain II ("TMD II"),(e.g., GRWVPGAVYALYGMWPLLLLLALPQRAYA (SEQ ID NO.: 6)), added to the BLM, were able to form channels on their own as determined by lack of a channel signal. (Data not shown.) Even if both domains were added to the BLM, no channel was formed. (Data not shown.)
Increasing drug concentrations of iminosugar derivatives were added to the buffer on one side of the membrane and their effect on p7-induced channel activity was followed. With the short alkylchain derivatives NB-DGJ and NB-DNJ, p7 channel activity remains unchanged (Figure 4, top panels). Likewise, N-octylglucoside, up to 3.0 mM, had no effect on channel activity. (Data not shown.) However, addition of increasing amounts of the long alkylchain derivatives NN-DGJ, NN-DNJ and N7-oxanonyl-6-deoxy-DGJ led to a dose-dependent inhibition of p7 channel signals (Figure 4, bottom panels, and Figure 5). From graphical representations of the resulting integrated normalized current traces and their respective sigmoidal fits (Figure 6) the approximate binding constants were deduced: \( K_{\text{app}} = 110.4 \ (\pm \ 19.9) \) \( \mu \text{M} \) for NN-DGJ, \( K_{\text{app}} = 45.2 \ (\pm \ 10.7) \) \( \mu \text{M} \) for NN-DNJ, and \( K_{\text{app}} = 114.2 \ (\pm \ 18.3) \) \( \mu \text{M} \) for N7-oxanonyl-6-deoxy-DGJ. Complete blockage of channel activity is observed at about 140 \( \mu \text{M} \) for NN-DGJ, 105 \( \mu \text{M} \) for NN-DNJ, and 180 \( \mu \text{M} \) for N7-oxanonyl-6-deoxy-DGJ. No leak currents were observed with increasing concentrations of any of the drugs.

Similarly, addition of increasing amounts of the long alkylchain derivative, SP240, \((i.e., \ N-10\text{-oxaundecyl-1,6-dideoxygalactonojirimycin})\), led to a dose-dependent inhibition of p7 channel signals (Figure 7). Complete blockage of channel activity is observed at about 100 \( \mu \text{M} \) for SP240.

All patents and other references cited in the specification are indicative of the level of skill of those skilled in the art to which the inventions pertain, and are incorporated by reference in their entireties, including any
tables and figures, to the same extent as if each reference had been incorporated by reference in its entirety individually.

[0113] One skilled in the art would readily appreciate that the present are well adapted to obtain the ends and advantages mentioned, as well as those inherent therein. The methods, variances, and compounds/compositions described herein as presently representative of preferred embodiments are exemplary and are not intended as limitations on the scope of the inventions. Changes therein and other uses will occur to those skilled in the art, which are encompassed within the inventions.

[0114] It will be readily apparent to one skilled in the art that varying substitutions and modifications may be made to the inventions disclosed herein without departing from the scope and spirit of the inventions. For example, a variety of different binding pairs can be utilized, as well as a variety of different therapeutic and diagnostic agents. Thus, such additional embodiments are within the scope of the present inventions.

[0115] The inventions illustratively described herein suitably may be practiced in the absence of any element or elements, limitation or limitations which is not specifically disclosed herein. Thus, for example, in each instance herein any of the terms “comprising”, “consisting essentially of” and “consisting of” may be replaced with either of the other two terms. The terms and expressions which have been employed are used as terms of description and not of limitation, and there is no intention that in the use of such terms and expressions of excluding any equivalents of the features shown and described or portions thereof, but it is recognized that various modifications are
possible within the scope of the inventions. Thus, it should be understood that although the present inventions have been specifically disclosed by preferred embodiments and optional features, modification and variation of the concepts herein disclosed may be resorted to by those skilled in the art, and that such modifications and variations are considered to be within the scope of these inventions.

[0116] In addition, where features or aspects of the inventions are described in terms of Markush groups or other grouping of alternatives, those skilled in the art will recognize that the inventions are also thereby described in terms of any individual member or subgroup of members of the Markush group or other group.

[0117] Also, unless indicated to the contrary, where various numerical values are provided for embodiments, additional embodiments are described by taking any 2 different values as the endpoints of a range. Such ranges are also within the scope of the described inventions.
WHAT IS CLAIMED IS:

1. A method of treating a hepatitis C virus (HCV) infection comprising:

administering to a subject in need thereof a compound selected from a group consisting of compounds of formula I or II, related isomers, pharmaceutically acceptable salts, and solvates thereof:

![Diagram of molecular structures](image)

wherein each substituent \( R^{11}, R^{11'}, R^{12}, R^{12'}, R^{13}, R^{13'}, R^{14}, R^{14'}, R^{15}, R^{15'}, R^{31}, R^{31'}, R^{32}, R^{32'}, R^{33}, R^{33'}, R^{34}, \) and \( R^{34'} \) is selected, independently from each other, from a group consisting of \(-H; -OH; -F; -Cl; -Br; -I; -NH_2; alkyl- and dialkylamino; linear or branched C\(_{1-6}\) alkyl, C\(_{2-6}\) alkenyl and alkynyl; aralkyl; linear or branched C\(_{1-6}\) alkoxy; aryloxy; aralkoxy; -(alkylene)oxy(alkyl); -CN; -NO\(_2\); -COOH, -COO(alkyl); -COO(aryl); -C(O)NH(C\(_{1-6}\) alkyl); -C(O)NH(aryl); sulfonyl; (C\(_{1-6}\) alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C\(_{1-6}\) alkyl)sulfamoyl; (C\(_{1-6}\) alkyl)thio; (C\(_{1-6}\) alkyl)sulfonamide; arylsulfonamide; -NHNH_2; -NHOH; aryl; and heteroaryl, wherein each substituent may be the same or different;

wherein each alkyl, alkenyl, alkynyl, aryl, and heteroaryl moiety may be optionally substituted with one or more groups independently selected from \(-OH; -F; -Cl; -Br; -I; -NH_2; alkyl- and dialkylamino; linear or branched C\(_{1-6}\) alkyl, C\(_{2-6}\) alkenyl and alkynyl; aralkyl; linear or branched C\(_{1-6}\) alkoxy, aryloxy; aralkoxy; -(alkylene)oxy(alkyl); -CN, -NO\(_2\), -COOH, -COO(alkyl); -COO(aryl); -C(O)NH(C\(_{1-6}\) alkyl); -C(O)NH(aryl); sulfonyl; (C\(_{1-6}\) alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C\(_{1-6}\) alkyl)sulfamoyl; (C\(_{1-6}\) alkyl)thio; (C\(_{1-6}\) alkyl)sulfonamide; arylsulfonamide; -NHNH_2; and -NHOH; and
R² and R⁴ are substituents selected independently of each other from a group consisting of linear C₇-₁₈ alkyl, substituted C₁-₁₈ alkyl, branched C₃-₁₈ alkyl, C₂-₁₈ alkenyl and alkynyl, and aralkyl;

wherein each linear C₇-₁₈ alkyl, branched C₃-₁₈ alkyl, C₂-₁₈ alkenyl and alkynyl, and aralkyl optionally may be substituted, and each substituted C₁-₁₈ alkyl is substituted with one or more groups independently selected from a group consisting of -OH; -F; -Cl; -Br; -I; -NH₂; alkyl- and dialkylamino; linear or branched C₁-₆ alkyl, C₂-₆ alkenyl and alkynyl; aralkyl; linear or branched C₁-₆ alkoxy, aryloxy; aralkoxy; -CN, -NO₂, -COOH, -COO(alkyl; -COO(aryl); -C(O)NH(C₁-₆ alkyl); -C(O)NH(aryl); sulfonyl; (C₁-₆ alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C₁-₆ alkyl)sulfamoyl; (C₁-₆ alkyl)thio; (C₁-₆ alkyl)sulfonamide; arylsulfonamide; -NHNH₂; and -NHOH.

2. The method according to claim 1 further comprising contacting one or both of an HCV p7 protein and components of a membrane that contains the p7 protein with the compound.

3. The method according to claim 1 wherein the compound is of the formula I.

4. The method according to claim 3 wherein at least one of R¹¹, R¹¹', R¹², R¹²', R¹³, R¹³', R¹⁴, R¹⁴', R¹⁵, and R¹⁵' is -CH₂OH.

5. The method according to claim 3 wherein at least one of R¹¹, R¹¹', R¹², R¹²', R¹³, R¹³', R¹⁴, R¹⁴', R¹⁵, and R¹⁵' is -OH.

6. The method according to claim 3 wherein R² is a linear C₇-₁₈ alkyl, branched C₃-₁₈ alkyl, or a substituted C₁-₁₈ alkyl group.

7. The method according to claim 6 wherein R² is a linear C₇-₁₁ alkyl, branched C₇-₁₁ alkyl, or a substituted C₇-₁₁ alkyl group.
8. The method according to claim 3 wherein at least two of R\textsuperscript{11}, R\textsuperscript{11'}, R\textsuperscript{12}, R\textsuperscript{12'}, R\textsuperscript{13}, R\textsuperscript{13'}, R\textsuperscript{14}, R\textsuperscript{14'}, R\textsuperscript{15}, and R\textsuperscript{15'} are selected from a group consisting of \(-\text{CH}_3\), \(-\text{CH}_2\text{OH}\), and \(-\text{OH}\).

9. The method according to claim 8 wherein the compound is one selected from a group consisting of:

related isomers, and mixtures thereof.
10. The method according to claim 9 wherein the compound is one selected from a group consisting of compounds set forth in the following table:
11. The method according to claim 1 wherein the compound is one selected from the group consisting of:

\[
\begin{align*}
&\text{OH} & \text{OH} & \text{OH} & \text{OH} & \text{OH} \\
&\text{N} & \text{R}^2 & \text{OH} & \text{OH} & \text{OH} & \\
&\text{OH} & \text{OH} & \text{OH} & \text{OH} & \text{OH} & \\
&\text{N} & \text{R}^2 & \text{OH} & \text{OH} & \text{OH} & \\
&\text{OH} & \text{OH} & \text{OH} & \text{OH} & \text{OH} & \\
&\text{N} & \text{R}^2 & \text{OH} & \text{OH} & \text{OH} & , \text{and}
\end{align*}
\]

mixtures thereof.

12. The method according to claim 11 wherein \(R^2\) is a linear \(C_{7-18}\) alkyl, branched \(C_{3-18}\) alkyl, or a substituted \(C_{1-18}\) alkyl group.

13. The method according to claim 11, wherein \(R^2\) is a linear \(C_{7-11}\) alkyl, branched \(C_{7-11}\) alkyl, or a substituted \(C_{7-11}\) alkyl group.

14. The method according to claim 11, wherein \(R^2\) is a linear \(C_{7-18}\) alkyl.

15. The method according to claim 14, wherein \(R^2\) is a linear \(C_{7-11}\) alkyl.

16. The method according to claim 15, wherein \(R^2\) is \(n\)-nonyl.

17. The method according to claim 11, wherein \(R^2\) is a linear or branched \(C_{1-18}\) alkyl group substituted with a \(C_{1-6}\) alkoxy group.

18. The method according to claim 17, wherein \(R^2\) is \(7\)-oxanonyl.

19. The method according to claim 17, wherein \(R^2\) is \(10\)-undecyl.

20. The method according to claim 1, wherein the compound is \(N\)-nonyl-DNJ.

21. The method according to claim 1, wherein the compound is \(N\)-nonyl-DGJ.
22. The method according to claim 1, wherein the compound is N-7-
oxanonyl-6-deoxy-DGJ.

23. The method according to claim 1, wherein the compound is N-10-
oxaundecyl-methyl-DGJ.

24. The method according to claim 1 wherein the compound is of the
formula II.

25. The method according to claim 24, wherein at least one of R\textsuperscript{31},
R\textsuperscript{31'}, R\textsuperscript{32}, R\textsuperscript{32'}, R\textsuperscript{33}, R\textsuperscript{33'}, R\textsuperscript{34}, and R\textsuperscript{34'} is -CH\textsubscript{2}OH.

26. The method according to claim 24, wherein at least one of R\textsuperscript{31},
R\textsuperscript{31'}, R\textsuperscript{32}, R\textsuperscript{32'}, R\textsuperscript{33}, R\textsuperscript{33'}, R\textsuperscript{34}, and R\textsuperscript{34'} is -OH.

27. The method according to claim 24, wherein at least two of R\textsuperscript{31},
R\textsuperscript{31'}, R\textsuperscript{32}, R\textsuperscript{32'}, R\textsuperscript{33}, R\textsuperscript{33'}, R\textsuperscript{34}, and R\textsuperscript{34'} are selected from the group consisting of
-CH\textsubscript{3}, -CH\textsubscript{2}OH, and -OH.

28. The method according to claim 27, wherein R\textsuperscript{4} is a linear C\textsubscript{7-18}
alkyl, a branched C\textsubscript{3-18} alkyl, or a substituted C\textsubscript{1-18} alkyl group.

29. The method according to claim 27, wherein R\textsuperscript{4} is a linear C\textsubscript{7-11}
alkyl, a branched C\textsubscript{7-11} alkyl, or a substituted C\textsubscript{7-11} alkyl group.

30. The method according to claim 27, wherein R\textsuperscript{4} is a linear or
branched C\textsubscript{1-18} alkyl group substituted with a C\textsubscript{1-6} alkoxy group.

31. The method according to claim 27, wherein R\textsuperscript{4} is n-nonyl.

32. The method according to claim 27, wherein R\textsuperscript{4} is 7-oxanonyl.

33. The method according to claim 27, wherein R\textsuperscript{4} is 10-oxaundecyl.

34. The method of claim 2, wherein the membrane that contains the
p7 protein has an increased permeability relative to a membrane that does not
contain the p7 protein and the compound reduces the increased permeability.
35. The method of claim 34, wherein the compound inhibits channel formation.

36. The method of claim 34, wherein the compound is a channel blocker.

37. The method of claim 1, wherein the subject is a human.

38. A method of screening for a potential HCV antiviral agent comprising:
   incorporating at least one of a p7 protein and a variant into a membrane to create a p7-containing membrane, wherein the p7-containing membrane has an increased permeability relative to a membrane that does not contain p7;
   contacting one or more components of the p7-containing membrane with a test compound;
   comparing the permeability of the p7-containing membrane, wherein one or more components have been contacted with a test compound, to the permeability of a p7-containing membrane, wherein none of the components have been contacted with a test compound.

39. The method according to claim 38, wherein the p7 protein is selected from a member of HCV clade 1.

40. The method according to claim 38, wherein the p7 protein comprises the amino acid sequence ALENVLNLAASLAGTHGLVSFLVFCCFAWYLKGRWVPAGAVYALYGMWPLLLLLLA LPQRAYA (SEQ ID NO.: 1).

41. The method according to claim 38, wherein the p7 variant comprises at least one transmembrane domain.

42. The method according to claim 41, wherein the p7 variant comprises at least one of a sequence of amino acids from about position 10 to about position 32 and a sequence of amino acids from about position 36 to about position 58 of a chosen p7 protein.
43. The method according to claim 41, wherein greater than about 70% of the amino acids of the transmembrane domain are members of the group consisting of F, I, W, Y, L, V, M, P, C, and A.

44. The method according to claim 38, wherein the p7 variant comprises biotinylated p7 protein.

45. The method according to claim 38, wherein the p7 protein is contacted with the test compound.

46. The method according to claim 38, wherein the permeability is compared by recording electrical currents through the membrane.

47. The method according to claim 38, wherein the membrane comprises a black lipid membrane.

48. The method according to claim 38, wherein the test compound inhibits channel formation.

49. The method according to claim 38, wherein the test compound is a channel blocker.

50. The method according to claim 38, wherein the test compound is selected from the group consisting of compounds of formula I or II, related isomers, pharmaceutically acceptable salts, and solvates thereof:

![Chemical Structures](image)

wherein each substituent R^{11}, R^{11'}, R^{12}, R^{12'}, R^{13}, R^{13'}, R^{14}, R^{14'}, R^{15}, R^{15'}, R^{31}, R^{31'}, R^{32}, R^{32'}, R^{33}, R^{33'}, R^{34}, and R^{34'} is selected, independently from each other, from a group consisting of -H; -OH; -F; -Cl; -Br; -I; -NH₂; alkyl- and dialkylamino; linear or branched C₁-₆ alkyl, C₂-₆ alkenyl and alkynyl; aralkyl;
linear or branched C_{1-6} alkoxy; aryloxy; aralkoxy; -(alkylene)oxy(alkyl); -CN; -NO_{2}; -COOH; -COO(alkyl); -COO(aryl); -C(O)NH(C_{1-6} alkyl); -C(O)NH(aryl); sulfonyl; (C_{1-6} alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C_{1-6} alkyl)sulfamoyl; (C_{1-6}
alkyl)thio; (C_{1-8} alkyl)sulfonamide; arylsulfonamide; -NHNH_{2}; -NHOH; aryl; and
heteroaryl; wherein each substituent may be the same or different;

wherein each alkyl, alkenyl, alkynyl, aryl, and heteroaryl moiety may be
optionally substituted with one or more groups independently selected
from the group consisting of -OH; -F; -Cl; -Br; -I; -NH_{2}; alkyl- and
dialkylamino; linear or branched C_{1-6} alkyl, C_{2-6} alkenyl and alkynyl;
aryl; linear or branched C_{1-6} alkoxy, aryloxy; aralkoxy; -
(alkylene)oxy(alkyl); -CN, -NO_{2}, -COOH, -COO(alkyl); -COO(aryl); -
C(O)NH(C_{1-6} alkyl); -C(O)NH(aryl); sulfonyl; (C_{1-6} alkyl)sulfonyl;
arylsulfonyl; sulfamoyl, (C_{1-6} alkyl)sulfamoyl; (C_{1-6} alkyl)thio; (C_{1-6}
alkyl)sulfonamide; arylsulfonamide; -NHNH_{2}; and -NHOH; and
R^{2} and R^{4} are substituents selected independently of each other from a group
consisting of linear C_{7-18} alkyl, substituted C_{1-18} alkyl, branched C_{3-18} alkyl, C_{2-18}
alkenyl and alkynyl, and aralkyl;

wherein each linear C_{7-18} alkyl, branched C_{3-18} alkyl, C_{2-18} alkenyl and
alkynyl, and aralkyl optionally may be substituted, and each substituted
C_{1-18} alkyl is substituted with one or more groups independently selected
from a group consisting of -OH; -F; -Cl; -Br; -I; -NH_{2}; alkyl- and
dialkylamino; linear or branched C_{1-6} alkyl, C_{2-6} alkenyl and alkynyl;
aralkyl; linear or branched C_{1-6} alkoxy, aryloxy; aralkoxy; -CN, -NO_{2}, -
COOH, -COO(alkyl); -COO(aryl); -C(O)NH(C_{1-6} alkyl); -C(O)NH(aryl);
sulfonyl; (C_{1-6} alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (C_{1-6} alkyl)sulfamoyl;
(C_{1-6} alkyl)thio; (C_{1-8} alkyl)sulfonamide; arylsulfonamide; -NHNH_{2}; and
-NHOH.

51. The method according to claim 38, wherein the test compound is
amantadine or a derivative thereof.

52. A kit for treating a hepatitis C virus (HCV) infection comprising:
(A) a compound of formula I or II, related isomers, pharmaceutically acceptable salts, or solvates thereof:

wherein each substituent \( R^{11}, R^{11'}, R^{12}, R^{12'}, R^{13}, R^{13'}, R^{14}, R^{14'}, R^{15}, R^{15'}, R^{31}, R^{31'}, R^{32}, R^{32'}, R^{33}, R^{33'}, R^{34}, \) and \( R^{34'} \) is selected, independently from each other, from a group consisting of \(-\text{H}; -\text{OH}; -\text{F}; -\text{Cl}; -\text{Br}; -\text{I}; -\text{NH}_2; \) alkyl- and dialkylamino; linear or branched \( \text{C}_{1-6} \) alkyl, \( \text{C}_{2-6} \) alkenyl and alkynyl; aralkyl; linear or branched \( \text{C}_{1-6} \) alkoxy; aryloxy; aralkoxy; -(alkylene)oxy(alkyl); -CN; -NO_2; -COOH; -COO(alkyl); -COO(aryl); -(O)NH(\( \text{C}_{1-6} \) alkyl); -(O)NH(aryl); sulfonyl; (\( \text{C}_{1-6} \) alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (\( \text{C}_{1-6} \) alkyl)sulfamoyl; (\( \text{C}_{1-6} \) alkyl)thio; (\( \text{C}_{1-6} \) alkyl)sulfonamide; arylsulfonamide; -NHNH_2; -NH_2; aryl; and heteroaryl, wherein each substituent may be the same or different;

wherein each alkyl, alkenyl, alkynyl, aryl, and heteroaryl moiety may be optionally substituted with one or more groups independently selected from \(-\text{OH}; -\text{F}; -\text{Cl}; -\text{Br}; -\text{I}; -\text{NH}_2; \) alkyl- and dialkylamino; linear or branched \( \text{C}_{1-6} \) alkyl, \( \text{C}_{2-6} \) alkenyl and alkynyl; aralkyl; linear or branched \( \text{C}_{1-6} \) alkoxy, aryloxy; aralkoxy; -(alkylene)oxy(alkyl); -CN, -NO_2, -COOH, -COO(alkyl); -COO(aryl); -(O)NH(\( \text{C}_{1-6} \) alkyl); -(O)NH(aryl); sulfonyl; (\( \text{C}_{1-6} \) alkyl)sulfonyl; arylsulfonyl; sulfamoyl, (\( \text{C}_{1-6} \) alkyl)sulfamoyl; (\( \text{C}_{1-6} \) alkyl)thio; (\( \text{C}_{1-6} \) alkyl)sulfonamide; arylsulfonamide; -NHNH_2; and -NH_2; and

\( R^2 \) and \( R^4 \) are substituents selected independently of each other from a group consisting of linear \( \text{C}_{7-18} \) alkyl, substituted \( \text{C}_{1-18} \) alkyl, branched \( \text{C}_{3-18} \) alkyl, \( \text{C}_{2-18} \) alkenyl and alkynyl, and aralkyl;

wherein each linear \( \text{C}_{7-18} \) alkyl, branched \( \text{C}_{3-18} \) alkyl, \( \text{C}_{2-18} \) alkenyl and alkynyl, and aralkyl optionally may be substituted, and each substituted \( \text{C}_{1-18} \) alkyl is substituted with one or more groups independently selected from a
group consisting of -OH; -F; -Cl; -Br; -I; -NH₂; alkyl- and dialkylamino; linear or branched C₁₋₆ alkyl, C₂₋₆ alkenyl and alkynyl; aralkyl; linear or branched C₁₋₆ alkoxy, aryleoxy; aralkoxy; -CN, -NO₂, -COOH, -COO(alkyl); -COO(aryl); -C(O)NH(C₁₋₆ alkyl); -C(O)NH(aryl); sulfonyl; (C₁₋₆ alkyl)sulfonil; arylsulfonil; sulfamoyl, (C₁₋₆ alkyl)sulfamoyl; (C₁₋₆ alkyl)thio; (C₁₋₆ alkyl)sulfonamide; arylsulfonamide; -NHNH₂; and -NHOH; and

(B) instructions for treating HCV infection.

53. A composition of formula I or II, related isomers, pharmaceutically acceptable salts, or solvates thereof:

![Chemical structure](image)

wherein each substituent R¹¹, R¹¹', R¹², R¹²', R¹³, R¹³', R¹⁴, R¹⁴', R¹⁵, R¹⁵', R³¹, R³¹', R³², R³²', R³³, R³³', R³⁴, R³⁴', is selected, independently from each other, from a group consisting of -H; -OH; -F; -Cl; -Br; -I; -NH₂; alkyl- and dialkylamino; linear or branched C₁₋₆ alkyl, C₂₋₆ alkenyl and alkynyl; aralkyl; linear or branched C₁₋₆ alkoxy; aryleoxy; aralkoxy; -(alkylene)oxy(alkyl); -CN; -NO₂; -COOH, -COO(alkyl); -COO(aryl); -C(O)NH(C₁₋₆ alkyl); -C(O)NH(aryl); sulfonil; (C₁₋₆ alkyl)sulfonil; arylsulfonil; sulfamoyl, (C₁₋₆ alkyl)sulfamoyl; (C₁₋₆ alkyl)thio; (C₁₋₆ alkyl)sulfonamide; arylsulfonamide; -NHNH₂; -NHOH; aryl; and heteroaryl, wherein each substituent may be the same or different;

wherein each alkyl, alkenyl, alkynyl, aryl, and heteroaryl moiety may be optionally substituted with one or more groups independently selected from -OH; -F; -Cl; -Br; -I; -NH₂; alkyl- and dialkylamino; linear or branched C₁₋₆ alkyl, C₂₋₆ alkenyl and alkynyl; aralkyl; linear or branched C₁₋₆ alkoxy, aryleoxy; aralkoxy; -(alkylene)oxy(alkyl); -CN, -NO₂, -COOH, -COO(alkyl); -COO(aryl); -C(O)NH(C₁₋₆ alkyl); -C(O)NH(aryl); sulfonil; (C₁₋₆ alkyl)sulfonil; arylsulfonil; sulfamoyl, (C₁₋₆ alkyl)sulfamoyl; (C₁₋₆
alkyl)thio; (C₁₋₆ alkyl)sulfonamide; arylsulfonamide; -NHNH₂; and -NHOH; and
R² and R⁴ are 10-oxaundecyl.
