

Supplementary Figure 2

Bubble plot depicting the results of meta-regression analyses testing the moderation of the association between occupation and knee osteoarthritis by; (A) mean age of the sample, (B) gender distribution, (C) mean body mass index of the sample and (D) study quality ratings based on the Newcastle–Ottawa Scale. The red line indicates the fitted regression line from the random-effects meta-regressions. The size of the bubble is proportional to the precision of the study (that is, inversely proportional to the variance of the log odds ratio).
