Glossary of abbreviations

AEI	Adverse Events of Interest
ARI	Acute Respiratory Illness
CMMS	Cambridge Multimorbidity Score
CMR	Computerised Medical Record
DSA	Data Sharing Agreement
DSP	Data Security and Protection
EMIS	Egton Medical Information Systems (a CMR provider)
EU	European Union
GDPR	General Data Protection Regulation
GP	General Practice
ICD	International Classification of Diseases
ILI	Influenza-like illness
IMD	Index of Multiple Deprivation
ISO	International Standards Organisation (week)
NHS	National Health Service
ORCHID	Oxford Royal College of General Practitioners Clinical Informatics Digital Hub
PCSC	Primary Care Sentinel Cohort
PHE	Public Health England (superseded by UKHSA on 1 st October 2021)
PRINCIPLE	Platform Randomised trial of treatments in the Community for epidemic and Pandemic illnesses
RCGP	Royal College of General Practitioners
RSC	Research and Surveillance Centre
RSV	Respiratory Syncytial Virus
SOP	Standard Operating Procedures
SQUIRE	Surveillance, quality improvement, research and education
TPP	The Phoenix Partnership, providers of the SystemOne CMR system
UKHSA	UK Health Security Agency
WHO	World Health Organisation

Executive summary

The Oxford-Royal College of General Practitioners (RCGP) Research & Surveillance Centre (RSC) has been collaborating with the UK Health Security Agency (UKHSA) on infectious disease surveillance in primary care for over 50 years. The RSC has produced a Weekly Return of respiratory diseases and other disease surveillance, along with an Annual Report summarising network changes and surveillance highlights of the year. This annual report covers the activities of the RCGP RSC during the 2022/23 season, spanning from the 9th of May 2022 to the 7th of May 2023 (International Standards Organisation (ISO) Week 19 of 2022 to ISO Week 18 of 2023).

The impact of COVID-19 began to diminish during the 2022/23 season, but the RSC continued to expand in both the number of participating practices and its surveillance activities. Most of the 38 conditions monitored by the RSC returned to levels consistent with their five-year historical average in the 2022/23 season.

For virological surveillance, the RSC continued with its sampling programme that covered a range of respiratory infectious viruses. We also continued asymptomatic COVID-19 testing through serology sampling through the 2022/23 season.

The RSC continued to support the vaccine effectiveness studies conducted by the UKHSA, particularly focusing on the safety and effectiveness of COVID-19 vaccines during this season. The RSC continued its assessment of disparities in the clinical presentation of diseases, vaccine uptake and episode typing during this season.

The RSC's general practice network continued to expand during the 2022/23 season, reaching 8,448,735 registrants from 927 practices in week 18 of 2023, compared to 4,860,601 registered patients across 489 practices by week 19 of 2022. Member practices were provided with the opportunity to participate in research studies, including trials, particularly those related to COVID-19 during this season.

During the 2022/23 season, the RSC implemented a range of activities, including research on COVID-19 vaccine safety. We remain committed to continuing our surveillance work and contributing to public health efforts in England.

1. Introduction

Welcome to the Oxford-Royal College of General Practitioners (RCGP) Research and Surveillance Centre's (RSC) Annual Report for 2022-2023. This is our 56th year of infectious disease surveillance in primary care in England ¹. For over half a century, the RSC has produced a Weekly Return of respiratory diseases and other disease surveillance, along with an Annual Report summarising network changes and surveillance highlights of the year. The network's primary area of interest was the surveillance of influenza,² which was extended to include COVID-19 ³ after the outbreak of the pandemic in March 2020. The principal elements of RSC's work are infectious disease surveillance ⁴, virology and serology sampling and vaccine effectiveness studies.

Oxford-RCGP RSC reports the incidence rate of 38 monitored communicable and respiratory conditions in the member practices every week. This surveillance is facilitated by the routinely collected computerised medical records (CMRs) from participating general practices. We detect any abnormal trends in disease incidence, alerting participating practices and the UK Health Security Agency (UKHSA) to the potential risk of a disease outbreak. In addition to disease surveillance supported by CMR, RSC actively collects virology and serology samples ³ from member practices to enhance its respiratory disease surveillance. RSC also shared CMR data to support the vaccine effectiveness analyses carried out by UKHSA and some other research projects.

The number of RSC's participating general practices continued to increase this year. RSC maintains a close relationship with member practices and provides a number of benefits to practices for membership in the network. At the beginning of each surveillance season, a commissioning letter signed off by RCGP and UKHSA, detailing the activities within RSC, is shared with all participating practices. Every week, RSC communicates network updates to member practices through a newsletter. RSC also provides publicly available virology and serology dashboards ⁵ to inform member practices of circulating viruses.

We would like to thank all the member practices and their patients within our network. Without the support of our member practices and the use of their pseudonymised patients' data, we would not be able to carry out our crucial work of monitoring disease rates, assuring the effectiveness of national vaccination programmes, and participating in other research projects.

This report is based on the clinical data and testing results of the samples collected from 489 member practices and brings together the principal elements of our work. It covers the period from the 9th of May 2022 to the 7th of May 2023 (International Standards Organisation (ISO) Week 19 of 2022 to ISO Week 18 of 2023), which includes the entire 2022-2023 winter flu season. We summarise the key surveillance findings of the year and highlight the changes in the RSC surveillance network.

2. What we do

RSC's aim

RSC is dedicated to ensuring the health and safety of communities by implementing comprehensive disease surveillance and conducting advanced research. The scope of RSC's use of data is for Surveillance, Quality Improvement, Research and Education (SQUIRE) purposes ⁶.

RSC builds a nationally representative Primary Care Sentinel Cohort (PCSC) by recruiting member practices across England and Wales, ensuring a wide and balanced geographical distribution. The representativeness of the population was evaluated based on region, age, sex, ethnicity, socioeconomic status (measured by the Index of Multiple Deprivation, IMD), smoking status, obesity status, comorbidities (measured by the Cambridge Multimorbidity Score, CMMS), and frailty (Appendix A).⁷

RSC's pseudonymised patient-level primary care database captures clinical information of patients registered with RSC member practices through the CMR system. We are particularly interested in capturing clinical information on (1) the presentation of symptoms suggestive of respiratory infections such as influenza-like illness (ILI) or acute respiratory illness (ARI); (2) the diagnoses of respiratory infectious diseases, including influenza, COVID-19, and other pathogens; (3) the diagnoses of diseases caused by environmental factors, such as hay fever; and (4) detailed vaccination and some other treatment records of the patients. A subset of the PCSC collects virology swabs and/or blood samples for virological and/or serological analysis.

RSC's disease surveillance was conducted across the PCSC but reported separately for both the entire population and carefully curated risk groups, such as geographical areas and age groups. The purpose was to identify high-risk groups for the monitored conditions.

Monitoring disease incidence

The Oxford-RCGP RSC works in close collaboration with the UKHSA. The principal funding of the RSC is from the UKHSA, this collaboration with UKHSA and its predecessors has been running successfully for over 50 years ¹. The RSC is UKHSA's principal primary care surveillance system, working in collaboration with other sources of health service data. The RSC is recruited to be nationally representative (Appendix A).

Our data feeds into UKHSA's surveillance system, providing an early warning of epidemics or unusual patterns of disease. Our monitoring alerts health services to seasonal events that place pressure on resources, such as the start of seasonal influenza epidemics and allows services to be planned accordingly.

In the 2022/23 season, we monitored on a weekly basis the incidence rate of 38 communicable and respiratory diseases specified by UKHSA (Table 1). The incidence rate was based on the diagnoses recorded by general practitioners in our member practices during the week.

The legal basis of our work with UKHSA is The Health Service (Control of Patient Information) Regulations 2002 which allows data to be disclosed for public health purposes without patient consent in England and Wales. Our surveillance work with UKHSA is under Regulation 3. The specific projects, including the extension to conduct COVID-19 surveillance, were individually approved by the UKHSA Caldicott Guardian, and is renewed on an annual basis. All other studies obtain their own ethical approval.

Table 1. The 38 conditions / groups of conditions monitored by the RCGP RSC network and their mappings to the World Health Organisation's International Classification of Disease version 10

Condition Name	ICD-10
1. Water and Food Borne Disorders	
Intestinal Infections	A00-A0
Viral Hepatitis	B15-B19
Non-infective Enteritis / Colitis	K50-K52
2. Environmentally Sensitive Disorders	
Asthma	J45-J46
Conjunctivitis	H10-H13
Respiratory / Chest symptoms	R05-R07; R09
Hay fever / Allergic Rhinitis	J30
3. Respiratory Infections	
Acute Bronchitis	J20-J21; J4
Laryngitis / Tracheitis	J04
Respiratory disorders	J00-J99
Tonsillitis / Pharyngitis	J02-J03
Infectious Mononucleosis	B27
Common Cold	R05 - R07; R09
Pleurisy	R091
Acute Sinusitis	J01
Upper Respiratory Tract Infection	J00-J06
Lower Respiratory Tract Infection	J20-J22
Influenza-like illness	J09-J11
Pneumonia / Pneumonitis	J12-J18
Strep throat / peritonsillar abscess	A38; J020; J36
Pertussis	A37
Acute Otitis Media	H650-H651; H660; H669
COVID-19 infection	U07
4. Vaccine Sensitive Disorders	
Measles	B05
Mumps	B26
Rubella	B06
5. Skin Contagions	
Bullous Dermatoses	L10-L14
Herpes Zoster	B02
Skin symptoms	R20-R23
Chickenpox	B01
Skin / subcutaneous infection	L00-L08
Impetigo	L01
Herpes Simplex	B00
Scabies	B86
6. Disorders Affecting the Nervous System	
Peripheral Neuropathy	G50-G64; G70-G72
Meningitis and Encephalitis	A170-A171; A390; A83-A85; A87; G00-G05
Musculoskeletal symptoms	R25-R29
7. Genitourinary System Disorders	
Urinary Tract Infection	N30; N390

Collecting virology and serology samples

A subset of the PCSC (n=180) collects virology swabs and/or blood samples for virological and/or serological analysis ⁸. Only virological results are reported back to PCSC practices and the patient, although it must be stressed that this is not a diagnostic service. Practices are reimbursed for each virology and serology sample they submit for laboratory testing and code accurately in the CMR. Both virology and serology samples are transported to UKHSA reference laboratories where they are analysed and stored in dedicated biobanks for onward research.

Virology samples were collected randomly from throat swabs taken from patients presenting with ILI, ARI (including upper respiratory tract infections (URTI) and lower respiratory tract infections (LRTI)) and suspected COVID-19 in RSC participating practices. This is to identify organisms with epidemic or pandemic potential and analyse the details (i.e. sequencing) of the circulating viruses, especially in winter seasons. Virological samples collected in RSC participating practices were analysed in UKHSA's respiratory virus reference laboratory in Colindale, London. The analysis of viruses in the 2022/23 season includes COVID-19, influenza, respiratory syncytial virus (RSV), human metapneumovirus (hMPV), adenoviruses, rhinovirus, enterovirus and other coronaviruses.

Serology samples were obtained opportunistically from volunteer patients attending routine blood tests at sampling practices within the PCSC ⁸. These patients may be having blood tests as part of an acute illness or chronic disease management or prevention, leading to an overrepresentation of risk groups. These samples are primarily used to estimate population exposure to COVID-19 ⁹; however, serological surveillance has also been successfully applied to monitoring levels of population exposure to influenza and diphtheria ⁸. From time to time, samples may also be used for testing antibody levels for other communicable diseases which may be circulating in the community for the effectiveness of associated vaccines. Serology samples are managed by UKHSA's Vaccine Evaluation Unit in Manchester.

Measuring vaccine effectiveness

RSC contributes crucial clinical data for vaccine effectiveness studies carried out by the UKHSA. UKHSA regularly evaluates the effectiveness of influenza vaccines before the COVID-19 pandemic to inform its vaccination policy ¹⁰. During 2022/23, the vaccines that were evaluated using RSC data were the influenza vaccine and the COVID-19 vaccine ⁹. RSC provided patient clinical data and vaccination records to support vaccine uptake studies in both general and target populations and vaccine effectiveness studies on circulating viruses, especially influenza.

Identifying disparities in the clinical presentation of diseases

The richness of RSC's clinical data allows us to identify demographic factors around clinical presentations (Appendix C). The aim of this is to understand any disparities in clinical presentation ⁹, concerning key demographic characteristics. This should guide clinical practice in identifying at-risk groups, and provide a strong basis for public health interventions.

Helping to change clinical practice

The RSC relies on practices agreeing to share their pseudonymised patient data with us – and, in return, their aggregated data provides evidence for research that is used to improve clinical practice and patient outcomes.

We want to provide benefits for our practices beyond their altruism in supporting public health. We pay practices for the time involved in taking specimens and our practice liaison team provide a range of feedback to practices to improve engagement with our work ¹¹, and the quality of data collected. This includes the weekly newsletter and access to real-time dashboards for practices to see the number of microbiological samples they have provided in comparison to the whole RSC network. We continue to encourage high-quality clinical records, such as primary care CMR and vaccine exposure data, to support vaccine effectiveness studies for COVID-19 and influenza vaccines. Member practices also have the opportunity to participate in research studies including trials.

3. What was new this year

In the previous 2021/22 season, the RSC progressively reintroduced virology testing for viruses other than COVID-19. The Moderna COVID-19 vaccine was introduced in the UK as part of Phase 2 of the COVID-19 vaccination program on 13 April 2021.

In this 2022/23 season, we focused on studying vaccine coverage ⁹ and COVID-19 vaccine benefit and risk ¹². We expanded our virology sampling from patients presenting with ILI only to include those presenting with ILI, ARI (including URTI and LRTI) and suspected COVID-19. We developed and validated a new phenotype to improve ARI recording, which was implemented in subsequent seasons ¹¹. A new episode typing algorithm has been applied, removing reliance on clinician-entered data in the computerised medical records. The algorithm uses disease specific interval between relevant observations to distinguish new and ongoing episodes ¹³.

4. The RSC dataset

Our data extraction process and information governance

We have data sharing agreement (DSA) with our RSC member practices. They agree to provide pseudonymised data for “SQuIRE” purposes ⁶, namely surveillance, quality improvement, research and education. Patients who have withheld consent for data sharing, for any reason, are excluded from our analyses. These patients are identified through an ‘opt-out’ code, which the automatic extraction process uses to exclude them.

CMR data from member practices is extracted using a pseudonymised NHS number as the unique key linking identifier, either daily or twice weekly. Data are pseudonymised (this is a process that scrambles any strong identifiers such as name, NHS number, and date of birth) as close to the source as possible, this varies between brands of computer systems, for example, Egton Medical Information Systems (EMIS) and The Phoenix Partnership (TPP) SystmOne. All data transfers are encrypted.

The pseudonymised NHS numbers and pseudonymisation algorithm for data linkage enable us to link data to other data sources at an individual level, without knowing the identity of these individuals. This includes linkage to results held by UKHSA, hospital and death data, and other disease registries.

Additionally, we can link to other data collected from individually consented patients. All of the data were handled following the OXFORD-RCGP RSC Data Management Standard Operating Procedures (SOPs). This met NHS Digital's Data Security and Protection (DSP) Toolkit requirements.

The Oxford Royal College of General Practitioners Clinical Informatics Digital Hub (ORCHID) is compliant with Data Protection Legislation, which relates to the protection of individuals with regard to the Processing of Personal Data to which a Party is subject, including the Data Protection Act 1998 and EU Directive 95/46/EC, and the subsequent General Data Protection Regulation ((EU) 2016/679) ("GDPR"). It is also compliant with the NHS DSP and subject to DSA with all relevant parties.

The dataset used for the RSC annual report 22/23

The dataset used in this report was extracted from the ORCHID database in April 2025. This report covers the period from 9 May 2022 to 7 May 2023 (ISO Week 19 of 2022 to ISO Week 18 of 2023). It includes 4,860,601 registrants from 489 practices in week 19 of 2022 and 8,448,735 registrants from 927 practices in week 18 of 2023. This includes all patients who were registered with one of the RSC member practices for at least one week during the reporting period. The datasets for swabbing results and vaccine effectiveness were defined differently for the specific purposes of the end-of-influenza season report.

For the week-by-week disease incidence graphs, we include episodes of disease in the numerator if the patient was validly registered with a practice within the RSC network at the time of the episode. The denominator includes all registered patients for that particular week.

Representativeness of the RSC sample population

Our goal is to ensure that the RSC database is as representative as the national population, thereby minimising sampling bias in studies conducted using our data. This section presents the demographic (age and gender) breakdown of our sample population for the 2022/23 season and compares it with that of England as a whole. The geographical distribution of the RSC practices is also presented in this section. The sample population includes all patients who were registered with an RSC member practice for at least one week during the reporting period.

The RSC sample population has increased after more practices joined our network this season, but it remains generally representative of the national population in terms of age and sex distribution. However, individuals under 18 years old are slightly under-represented (Figure 1). A detailed age-sex breakdown of the RSC network across NHS regions is presented in Appendix A.

Age Sex Profile

Figure 1. The age-sex profile of the RSC sample population compared with the England national population

Note: the bars show the number of patients within our dataset, by gender and age band, and the lines show the distribution of the corresponding population of England as a whole.

We aim to maintain a balanced geographical distribution of the RSC member practices by varying our priorities for recruitment. The distribution of the RSC member practices in the 2022/23 season is presented in Figure 2.

Figure 2. Distribution of RSC member practices among NHS regions in England in the 2022/23 season

5. COVID-19 and Influenza

Work on COVID-19 and influenza is the central part of the RSC's activity in the 2022/23 season. In addition to surveillance of the weekly incidence of influenza-like illness, we conducted a programme of virological swabbing throughout the flu season and analysed vaccine uptake and effectiveness.

Virology sampling programme

In the 2021/22 season, virology testing for viruses other than SARS-CoV-2 was progressively reintroduced. By the 2022/23 season, the RSC's virology sampling programme had returned to its normal operating mode. A total of 11,115 virology samples were collected in RSC in the 2022/23 season (Figure 3), more than double the number (11,115) collected in the previous season.

Figure 3. RSC's RSV, Influenza and SARS-CoV-2 Virology Swab Surveillance 2022/23 by viral strain

Serology sampling programme

In the 2022/23 season, a total of 27,880 serology samples were collected, of which 24,714 were linkable to the RSC's primary care data (Table 2). Most of the samples (99.3%) were taken from the adult population.

Table 2. Number of serology samples collected in the 2022/23 season

Age band	Number of Samples Collected	Number of Samples Matched
Missing*	847	0
<1yr	13	10
1-4yrs	3	3
5-14yrs	55	50
15-24yrs	606	480
25-44yrs	4039	2659
45-64yrs	8835	7718
65-74yrs	6677	5907
75-84yrs	5461	4824
85+yrs	1344	1184
Total	27880	22835

*Age was missing in the serology sample data

Vaccine uptake

At RSC, we monitor the uptake of the influenza vaccine in the population groups outlined in the flu vaccination program rolled out by UKHSA¹⁴. The extended flu vaccination programme was still running this season, which covered risk groups and adults aged 50-64 years.

In the 2022/23 season, the influenza vaccine uptake in the over 65 years group was satisfactory (77%), while the uptake was comparatively low in pregnant women (22%) and children aged 4-17 (36%) (Table 3).

GP records are of high quality for vaccinations carried out in primary care. However, where vaccinations are carried out outside primary care, data about these may not reach the primary care CMR¹⁵.

Table 3. Influenza vaccine uptake in the RSC practices 2022/23 season

Eligible group	Total eligible population	Vaccine coverage
Adults aged 65+	3,976,031	77%
Adults aged 55-64	4,112,635	47%
Children aged 4-17	3,172,784	33%
Children aged 2-3	443,933	43%
Pregnant women	341,952	22%
Risk group patients*	2,241,008	30%
Other**	8,400,783	4%
All patients	22,689,126	32%

* Risk groups are outlined in the flu vaccination program rolled out by UKHSA

** The "other" group tend to be carers and health workers

Vaccine effectiveness

RSC data was one of the primary data sources for UKHSA's evaluation of COVID-19 and influenza vaccine effectiveness and safety during the 2022/23 season. The text below is taken from the published evaluations.

We used a self-controlled case series design to estimate relative incidence (RI) of AEs reported to the national sentinel network, the Oxford-Royal College of General Practitioners Clinical Informatics Digital Hub. We compared AEs (overall and by clinical category) 7 days pre- and post-vaccination to background levels between 1 October 2020 and 12 September 2021.

Overall, medically attended adverse events of interest (AEIs) decreased post-vaccination against background levels. There was a 3-7% decrease in incidence within 7 days after both doses of Comirnaty (RI: 0.93; 95% CI: 0.91-0.94 and RI: 0.96; 95% confidence interval (CI): 0.94-0.98, respectively) and Vaxzevria (RI: 0.97; 95% CI: 0.95-0.98). A 20% increase was observed after one dose of Spikevax (RI: 1.20; 95% CI: 1.00-1.44). Fewer AEs were reported as age increased. Types of AEs, e.g. increased neurological and psychiatric conditions, varied between brands following two doses of Comirnaty (RI: 1.41; 95% CI: 1.28-1.56) and Vaxzevria (RI: 1.07; 95% CI: 0.97-1.78)¹⁶.

While it is recognised that COVID-19 vaccines are associated with a small increase in incidence of rare but serious adverse events, there has been less reporting of other milder and more common

AEIs. Against a list of prespecified medically attended AEIs, we found there was no increase in incidence following vaccination with either dose of Comirnaty or Vaxzevria, or the second dose of Spikevax. Standardised reporting of AEIs, possibly via sentinel systems, could provide safety data complementary to other mechanisms for monitoring vaccine safety.

6. Disease incidence

At RSC, we monitor and report the incidence of 38 conditions in our weekly disease surveillance reports. The incidence was presented by regions and age bands, and it was also compared with our 5-year average (Appendix B).

Graphs showing the weekly incidence of all monitored conditions in the 2022/23 season are included in Appendix B. These graphs follow the same format as those in the RSC weekly surveillance report but are presented as an annual amalgamation. The five-year average presented in the graphs was calculated using data from the 5-year period prior to the start of the season.

Disparities in the presentation of monitored conditions (Appendix C) indicate that health inequalities linked to deprivation, ethnicity, and rurality strongly influence the distribution of monitored conditions in England. Respiratory and infectious diseases are more frequently recorded among patients registered with practices in more deprived areas, highlighting a persistent association between deprivation and overall disease burden. Ethnic variation is also evident, with infections such as viral hepatitis and intestinal infections occurring more often among Asian and Black populations, while some respiratory conditions, including asthma and acute bronchitis, are more common among White groups.

There is no uniform urban–rural gradient across all monitored conditions. Many chronic and respiratory disorders show elevated rates in rural practices, possibly reflecting demographic structure (older populations), occupational exposures, and patterns of healthcare utilisation. In contrast, several communicable diseases and environmentally driven infections remain more frequent in urban and conurbation areas, consistent with higher population density and transmission opportunities. Age-related patterns are also apparent, with children and older adults contributing most to respiratory and infectious disease presentations.

The data are presented in this report by disease chapter. The key points for each chapter are as follows:

Water and food-borne disorders: Presentations of intestinal infections were slightly below the 5-year average during this season, although the London area recorded higher rates between January and March 2023. The incidence of non-infective enteritis/colitis and viral hepatitis mostly aligned with the 5-year average.

Environmentally-sensitive disorders: Asthma incidence remained slightly below the 5-year average in 2022 before rising modestly above average in early 2023. The North West region experienced a peak in asthma presentations in week 26 of 2022. The incidence of conjunctivitis was below the 5-year average in 2022 and returned to average levels in 2023 within the same season. The incidences of hay fever/allergic rhinitis and respiratory/chest symptoms were largely consistent with the 5-year average; however, respiratory/chest symptoms showed a notable peak in weeks 50 and 51 of 2022.

Respiratory infections: The incidence rates of acute bronchitis, pleurisy, and pertussis were slightly lower than the 5-year average throughout the 2022/23 season. Common cold, pneumonia/pneumonitis, lower respiratory tract infections, and acute otitis media were slightly below or aligned with the 5-year average overall, but each showed a modest peak during the winter season. Influenza-like illness, respiratory disorders, strep throat/peritonsillar abscess, tonsillitis/pharyngitis and upper respiratory tract infections were generally in line with the 5-year average, except for a significantly higher peak during the winter season. The incidences of laryngitis/tracheitis, acute sinusitis and infectious mononucleosis were in line with the 5-year average. COVID-19 incidence peaked in June and July 2022, with two subsequent, smaller peaks observed in October and December.

Vaccine-sensitive disorders: The incidence rates of measles, mumps and rubella were slightly below the 5-year average in the 2022/23 season.

Skin contagions: During the 2022/23 season, the incidence rates of bullous dermatoses, chickenpox, scabies, and impetigo largely aligned with the 5-year average. Herpes simplex, herpes zoster, skin/subcutaneous infection and skin symptoms were slightly below the 5-year average.

Disorders affecting the nervous system: Peripheral neuropathy, musculoskeletal symptoms and meningitis and encephalitis rates were mostly at the 5-year average in the 2022/23 season.

Genitourinary system disorders: The national incidence rate of urinary tract infections was considerably lower than the 5-year average in the 2022/23 season.

11. Appendices

Appendix A

Representativeness of the Oxford-RCGP RSC

This section shows the demographic (age and gender) breakdown of our sample population, and how it compares with that of England as a whole. This report covers the period 9th May 2022 to the 7th of May 2023 (ISO Week 19 of 2022 to ISO Week 18 of 2023). This includes all patients who were registered for at least one week during the reporting period, within a practice from the RCGP RSC network for which we received data.

Age Sex Breakdown by NHS Region

NHS Region	Gender	<1yr	1-4yrs	5-14yrs	15-24yrs	25-44yrs	45-64yrs	65-74yrs	75-84yrs	85+yrs
North East and Yorkshire	F	3,375	18,438	53,904	50,014	125,433	124,757	52,123	38,364	18,864
	M	3,722	19,237	56,453	51,467	125,891	126,467	50,333	32,993	11,675
North West	F	7,598	39,236	109,425	110,032	253,552	217,792	84,532	63,474	30,530
	M	8,053	41,060	115,054	111,545	270,997	236,185	83,433	54,899	19,070
East of England	F	3,068	17,196	48,824	43,490	113,834	102,802	38,149	30,505	16,544
	M	3,249	18,113	50,797	44,402	109,631	106,152	35,888	25,841	10,270
London	F	13,178	67,175	171,230	194,921	558,850	305,067	85,177	55,578	29,048
	M	14,131	70,658	178,985	187,123	598,596	351,104	81,527	44,498	17,820
Midlands	F	8,199	41,675	117,129	118,809	260,985	247,963	100,773	79,429	38,834
	M	8,584	44,054	122,820	122,972	270,213	258,369	97,562	69,131	24,453
South East	F	9,170	48,619	139,022	136,667	319,574	293,295	109,566	87,117	46,067
	M	9,805	51,413	146,952	140,505	324,118	303,818	104,078	74,244	28,342
South West	F	3,425	17,578	50,708	57,468	130,404	114,006	47,740	37,649	19,056
	M	3,507	19,195	53,284	57,896	136,255	117,057	45,536	32,778	12,137
National	F	48,013	249,917	690,242	711,401	1,762,632	1,405,682	518,060	392,116	198,943
	M	51,051	263,730	724,345	715,910	1,835,701	1,499,152	498,357	334,384	123,767

We work very hard to ensure that the demographics of our sample population closely resemble the country as a whole. This correspondence can be seen in the age-sex profile below; the bars show the number of patients within our dataset, broken down by gender and age-band, and the lines show the distribution of the corresponding population of England as a whole.

Age Sex Profile

The trends of sum of MalePop, sum of MaleONS, sum of FemalePop and sum of FemaleONS for Age in 5-year age bands. Color shows details about Gender.

As can be seen from the map below, practices within the Network are spread across England in order to reflect the distribution of the population as a whole. We vary our priorities for recruiting to try to ensure an even spread of practices.

Distribution of RSC practices among NHS regions in England
