TABLE 5

DORIC ORDER MEASUREMENTS:

COLUMN HEIGHTS, LOWER COLUMN DIAMETERS, INTERAXIALS

- in metres

Cycladic and Thasian monuments are highlighted in bold type; they are listed in the table even if only one requisite measurement is known or can be reasonably estimated. Other Greek buildings are only included if at least two of the measurements can be provided.

Figures separated by / refer to the front and side columns respectively.
For figures separated by // see endnotes referenced by superscripted numbers and letters.
* = significant, reasonably estimated value. ? = unknown value.
[ ] = value of a significantly widened central interaxial.

TABLES 7 – 13 and GRAPHS 1 – 7

A. GENERAL

Tables 7 – 13 each list the ratios of certain major elements within Doric colonnades and entablatures; ratios are given for all major Greek monuments from the mid-sixth century to the end of the Hellenistic period, and are tabulated according to regions.

Each Table is followed by an associated Graph which plots the ratio for each monument against time.

The ratios are derived from the most recent published measurements which are to be found on Table 5 (column heights, lower column diameters, interaxials) and Table 6 (architrave and frieze heights).

Symbols used on the Tables are explained at their head.

Symbols and monument identification numbers used on the Graphs are as follows:

B. SYMBOLS USED ON GRAPHS:

Location:

+ = South Italy and Sicily.

= Peloponnese and Central Greece.

= Attica and Aigina.

= Cyclades.

= Thasos.

= Asia Minor and Eastern Aegean.

Other Symbols:

= ratio of a significantly-widened central interaxial.

= chronological mid-point of a period of 50 years or more.

= mid-point of a range of ratios.

$\ldots^{a}\ \ldots^{b}$ = two differing interaxial ratios in the same colonnade; see foot of associated table.

Graph 4a has its symbols explained on the graph.

C. MONUMENT IDENTIFICATION NUMBERS USED ON GRAPHS:

Arranged numerically by date – see pages 32-33 below.

Arranged alphabetically – see pages 34-35 below.

ENDNOTES:

[1.] The glyph-top actually curves down slightly at its centre, forming a wavy line, as also occurs at the Temple of Zeus at Akragas and possibly at Temple GT at Selinous.

[2.] The glyph-top is in the form of a wavy line.

[3.] West wing of the Pi-shaped Stoa has an ear on its half-glyphs (form unpublished).

[4] The exact form of the ear is unknown.

[5.] The half-glyphs are unusually tall: the bottoms of the 'ears' are level with the top of the central glyphs.

[6.] The ear is in the form of an acanthus leaf.

[7.] The tops of the half-glyphs, in contrast to the whole glyphs, unusually incline upwards towards the edge.

continued...

[8] The ear is still in a `blocked out' stage, assuming no specific form.
[9] The ear assumes a more florid form than usual.
[10] Some glyph-tops curve down at their centre.
[11] Exact form now indeterminable.
