

Supplementary Figure S6. Significant changes to peripheral blood immune cell counts across the menstrual cycle. Heat map depicting changes in cell counts across the menstrual cycle for significantly altered populations; data comprised all endometriosis (n=15) and control (n=8) patients. Menstrual cycle was divided into four menstrual cycle quarters and window of implantation (WOI); cell counts detected at each stage are shown; $P_{adj} < 0.05$ and $|\log_2FC| > 1$ were applied.
