## A1 Data Description

### A1.1 List of Industries

- **Tables A1** presents the list of industries included in our analysis, as classified by the US Cluster Mapping Project. The project categorizes each 6-digit NAICS level industry into 67 industry groups.
- **Table A2** presents the number of commuting zones that serve as industrial hubs for each classified industry groups. Of the 722 CZs, 672 serve as hubs for one of the industry groups.

**Table A1:** List of Industries

INDUSTRIES
Aerospace Vehicles and Defense
Agricultural Inputs and Services
Apparel
Automotive
Biopharmaceuticals
Business Services
Coal Mining
Communications Equipment and Services
Construction Products and Services
Distribution and Electronic Commerce
Downstream Chemical Products
Downstream Metal Products
Education and Knowledge Creation
Electric Power Generation and Transmission
Environmental Services
Financial Services
Fishing and Fishing Products
Food Processing and Manufacturing
Footwear
Forestry
Furniture
Hospitality and Tourism
Information Technology and Analytical Instruments
Insurance Services
Jewelry and Precious Metals
Leather and Related Products
Lighting and Electrical Equipment
Livestock Processing
Marketing, Design, and Publishing
Medical Devices
Metal Mining
Metalworking Technology
Music and Sound Recording
Nonmetal Mining
Oil and Gas Production and Transportation
Paper and Packaging
Performing Arts
Plastics
Printing Services
Production Technology and Heavy Machinery
Recreational and Small Electric Goods
Textile Manufacturing
Tobacco
Trailers, Motor Homes, and Appliances
Transportation and Logistics
Upstream Chemical Products
Upstream Metal Manufacturing
Video Production and Distribution
Vulcanized and Fired Materials
Water Transportation
Wood Products
Local Commercial Services
Local Community and Civic Organizations
Local Education and Training
Local Entertainment and Media
Local Financial Services
Local Food and Beverage Processing and Distribution
Local Health Services
Local Hospitality Establishments
Local Household Goods and Services
Local Industrial Products and Services
Local Logistical Services
Local Motor Vehicle Products and Services
Local Personal Services (Non-Medical)
Local Real Estate, Construction, and Development
Local Retailing of Clothing and General Merchandise
Local Utilities

## A1.2 Survey Sample

- **Tables A3, A4, and A5** present the key summary statistics of demographic characteristics of the survey respondents recruited from the survey firms Dynata, Bilendi, and Respondi, respectively.
- **Table A6** describes the demographic characteristics of American workers according to the American Community Survey of 2021 (1-year estimate). In order to compare the characteristics of our survey respondents with those of adult working population in the US, we consider only currently employed individuals aged 18 or above.
- Respondents were recruited by survey firms through quota sampling. The survey samples demonstrated comparable demographic characteristics to the national working population in terms of age and gender distributions. Regarding educational attainment, the Dynata survey sample had 33.7% of college-educated individuals, which largely aligns with the national figure of 38.5%. The Bilendi and the Respondi survey samples, however, exhibited an over-representation of college-educated individuals, as described in Tables A4 and A5. This suggests that our findings on the perception of regional status loss, reported in Table 2, may under-estimate the effect size, since those without a college education were more likely to report group-based status threat and more supportive of Trump. The Dynata, Bilendi and Respondi surveys all appear to under-represent the Hispanic population. This discrepancy may stem from the way respondents were asked to self-identify with a single race/ethnicity category from the following options: White, Black or African American, Asian or Asian American, Hispanic or Latino, Native Hawaiian or Pacific Islander, American Indian or Alaska Native, and others. Majority of individuals with Hispanic ethnicity might have chosen the racial category of Whites.<sup>1</sup>

### A1.3 County-Level and CZ-Level Data

- **Tables A7** and **A8** present the summary statistics and the correlation matrix for the variables included in the analysis of county-level election results. Our dependent variable is the county-level change in the two-party vote share for Republican candidates between the 2000 and 2016 presidential elections. The economic shock measures – *TAA Demand in Hubs*, *TAA Demand in Non-Hubs*, and  $\Delta$  *Chinese Imports Shock* – with commuting-zone (CZ)-level economic indicators such as *Employment in Manufacturing*, *Employment in Routine Occupations*, and the *Offshorability Index*, are all measured at the commuting-zone level. All other variables are measured at the county level.

**Table A7:** Summary Statistics: County-Level and CZ-Level Data

	N	MEAN	SD	MIN	MAX
$\Delta$ GOP Vote Share	3107	7.88	10.23	-28.36	46.25
TAA Demand in Hubs	3107	4.06	12.75	0.00	170.48
TAA Demand in Non-Hubs	3107	34.41	33.36	0.00	304.43

## A2 Industrial Hubs and Economic Indicators

- **Table A9** examines the extent to which industrial hubs were exposed to greater trade-related shocks. Using industry-by-commuting zone as the unit of analysis, we estimate the effect of *Industrial Hub*, a binary indicator coded as 1 if a given industry is considered a hub within a commuting zone and 0 otherwise. The dependent variable is the logged number of TAA-petitioning workers in an industry-by-commuting zone cell from 2000 to 2015, normalized by the total number of workers in that cell as of 1999 (per 1,000 workers). Across models, we find that industries designated as hubs within commuting zones were statistically more likely to have a higher number of TAA-petitioning workers, even after accounting for industry and commuting zone fixed effects.
- **Table A10** reports the correlation between industrial hubs and exposure to Chinese import penetration, with commuting zones as the unit of analysis, while **Table A9** examines trade-related shocks by industry within each commuting zone. Consistent with expectations, **Table A10** shows that regions with industrial hubs were more exposed to shocks from Chinese import penetration than the other regions without any industrial hubs.

**Table A9:** Industrial Hubs and Trade-Related Shocks

<i>Dependent Variable:</i> TAA-Petitioning Workers, Logged			
	(1)	(2)	(3)
Industrial Hub	1.179** (0.231)	1.181** (0.206)	1.194** (0.183)
Commuting Zone FE	No	Yes	Yes
Industry Classification FE	No	No	Yes
Observations	48374	48374	48374

*Note:* +  $p < 0.10$ , \*  $p < 0.05$ , \*\*  $p < 0.01$ . Standard errors clustered by commuting zones in parentheses. Dependent variable is logged number of high school friends working in the same industry.

**Table A10:** Regions with Industrial Hubs and China Shock

<i>Dependent Variable:</i>	
	$\Delta$ Chinese import penetration
Regions with Industrial Hubs	0.367** (0.131)
Observations	722

*Note:* +  $p < 0.10$ , \*  $p < 0.05$ , \*\*  $p < 0.01$ . The dependent variable is  $\Delta$  Chinese import penetration, measured as the change in exposure to Chinese imports at the CZ level between 2000 and 2008.

## A3 Full Results and Supplementary Analysis

### A3.1 Industrial Hubs, Peer Networks and Political Beliefs

- **Table A11** presents the results on the effects of industrial hubs on the logged number of high school friends working in the same industry. In model (1), we estimate the effect of the location quotient (LQ) of an individual’s employed industry group within their commuting zone. In model (2), we examine the effect of residing in a region that serves as an industrial hub for any industry. Across both models, we consistently find that industrial hubs are associated with denser overlapping peer networks that are closely intertwined with industry.
- **Table A12** presents the full estimation results of Table 1, including the coefficients on control variables and their standard errors.
- **Tables A13, A14 and A15** present the results on the effects of trade shocks to industrial hubs on perceptions of political responsibility for economic downturns using the 95th, 85th and 80th percentile threshold, respectively, in determining a commuting zone’s degree of specialization in a given industry. The results are largely similar to the main findings.
- **Table A16** presents the estimation results of Table 1, excluding the control variables of union membership, perceived income, and partisanship. The results are largely similar to the main findings.

**Table A11:** Industrial Hubs and Peer Networks

### A3.2 Trade Shock, Industrial Hubs and Regional Status

- **Table A17** presents the full estimation results of Table 2, including the coefficients on control variables and their standard errors.
- **Tables A18, A19 and A20** present the results on the effects of trade shocks to industrial hubs on perceptions of regional standing using the 95th, 85th and 80th percentile threshold, respectively, in determining a commuting zone’s degree of specialization in a given industry. The results are largely similar to the main findings.
- **Table A21** presents the estimation results of Table 2, excluding the control variables of perceived income and partisanship. The results are largely similar to the main findings.
- **Table A22** examines whether the effects of trade shocks to industrial hubs (or non-hubs) vary depending on race/ethnicity. We test this by interacting a binary indicator for *Non-White* with *TAA Demand in Hubs* and *TAA Demand in Non-Hubs*, respectively. Our findings do not indicate that the effects are significantly different between Whites and non-Whites.

### A3.4 Trade Shock, Industrial Hubs and Electoral Behavior

- **Table A24** presents the full estimation results of Table 4, including the coefficients on control variables and their standard errors.
- **Tables A25, A26 and A27** present the results on the effects of trade shocks to industrial hubs on support for the Republican Party, using the 95th, 85th and 80th percentile threshold, respectively, in determining a commuting zone’s degree of specialization in a given industry. The results are largely similar to the main findings.
- **Table A28** presents the main results controlling for the commuting-zone level exposure to Chinese imports between 2000 and 2008. Our main findings remain unchanged when we include this control.
- **Table A29** presents the main results, focusing exclusively on the manufacturing sector. Even within this sector, trade-related job losses in industrial hubs are positively associated with support for the Republican presidential candidate in 2016, while shocks to manufacturing industries in non-hubs exhibit the opposite pattern. This finding suggests that the effects of economic shocks on manufacturing industries vary significantly depending on an industry’s ”hub” status within a region.

**Table A24:** Trade Shock to Industrial Hubs and Support for the Republican Party: Full Results

*Note:* +  $p < 0.10$ , \*  $p < 0.05$ , \*\*  $p < 0.01$ . Standard errors clustered by commuting zones reported in parentheses. Observations are weighted by the size of county measured as the number of total votes in 2000. Dependent variable is the change in the Republican party vote share, 2016-2000. *TAA Demand in Hubs* is measured as the number of estimated TAA-petitioning workers employed in industrial hubs between 2000 and 2016, expressed as a proportion per 1,000 workers based on CZ-level employment in 1999. *TAA Demand in Non-Hubs* is respectively measured as the number of TAA-affected workers employed in non-hubs.

*Note:* +  $p < 0.10$ , \*  $p < 0.05$ , \*\*  $p < 0.01$ . Standard errors clustered by commuting zones reported in parentheses. Observations are weighted by the size of county measured as the number of total votes in 2000. Dependent variable is the change in the Republican party vote share, 2016-2000. *TAA Demand in Hubs* is measured as the number of estimated TAA-petitioning workers employed in industrial hubs between 2000 and 2016, expressed as a proportion per 1,000 workers based on CZ-level employment in 1999. *TAA Demand in Non-Hubs* is respectively measured as the number of TAA-affected workers employed in non-hubs.
