

Table S1. Summary of the site characteristics, *Myrmica* ant community and *Myrmica* hosts for each of the 419 Sites. Sites are arranged by country, and names have been anonymized and latitude and longitude of each site given only to the nearest 0.1 degree to protect the identity of vulnerable sites.

*The information available from each site is characterized as follows:

H = The host ant species is reported.

N = The number of infested host nests is reported.

U = The number of uninfested host nests is reported.

M = The identity of all *Myrmica* (including non-hosts) found close to food plants is reported.

Y = The number of all *Myrmica* nests investigated (including non-hosts) found close to food plants is reported.

B = The distribution of *Myrmica* species close to host plants was assessed using baiting.

Q = Nests were excavated in late summer or autumn (before larvae had overwintered), and so data were not included in analysis.

†*Maculinea* are coded as:

H = *Ma.alcon* H

X = *Ma.alcon* X

R = *Ma.alcon* form *rebeli*

A = *Ma.arion*

N = *Ma.nausithous*

T = *Ma.teleius*.

Probability that host *Myrmica* are exploited in the

Number of nests of each *Myrmica* species examined (Number of nests with overwintered *Maculinea* ♀)

proportion encountered
