This article corrects:

Predictability in community dynamics

Volume 20, Issue 3, 293–306, Article first published online: 1 February 2017

Regarding the article ‘**Predictability in community dynamics**’ (Ecol. Lett. 20 (3), 293–306), the authors would like to correct the error in the Figure 2 caption. In the description, it should read “coarsened and smoothed data (**green curve**)” instead of “coarsened and smoothed data (blue curve)”

The caption should read as follows:

Figure 2 Definition of community response diagram statistics using an example data set. (a) A community’s trajectory of observed climate $F(t)$ and the community response $C(t)$ is shown for original data (black curve), coarsened data (grey curve) and coarsened and smoothed data (green curve). The 1:1 (no lag) expectation is shown as a diagonal red line. The maximum state number, n , indicates the largest number of unique values of $C(t)$ that correspond to any coarsened value of $F(t)$. It is calculated by intersecting a vertical line with the community’s trajectory at all values of $F(t)$ (vertical blue lines). (b) The mean absolute deviation, $|\bar{\Delta}|$; indicates the average difference between $C(t)$ and $F(t)$ across all times, with larger values indicating greater lags. The distribution of lags is shown as a grey envelope, and the statistic’s value is shown as a vertical blue line.

We apologize for any inconvenience caused.
