Critical Parties: How Parties Evaluate the Performance of Democracies

Robert Rohrschneider* and Stephen Whitefield**

While the ‘critical citizens’ literature shows that publics often evaluate democracies negatively, we know much less about ‘critical parties’, especially mainstream ones. This paper develops a model to explain empirical variation in parties’ evaluations of democratic institutions, based on two mechanisms: first, that parties’ *regime access* affects their regime support which, second, is moderated by over-time *habituation* to democracy. Using expert surveys of all electorally significant parties in 24 European countries in 2008 and 2013, the results show that parties evaluate institutions positively when they have regular access to a regime regardless of their ideology and a regime’s duration. Moreover, regime duration affects stances indirectly by providing democracies with a buffer against incumbent’s electoral defeat in the immediate past elections. Our findings point to heightened possibilities for parties to negatively evaluate democracies given the increased volatility in party systems in Europe.

Introduction

How do political parties in Europe evaluate the performance of national democracies? While the question is regularly asked about citizens,¹ prior research rarely examines the stances that

¹ For recent overviews see Dalton 2004; Hobolt 2012; Norris 2011; Thomassen 2014.

parties take on this issue. Perhaps the answer appears obvious: it is mostly parties at the electoral and ideological fringes that criticize existing institutions. However, mainstream and even governing parties can also be quite negative about democratic regimes, as was the case when the Liberal Democrats in the United Kingdom were in the governing coalition (see also table 1 below). But there is hardly any study that systematically considers the stances mainstream parties take about the performance of their institutions. Given the gap in the literature about this topic, our first goal is to describe the stances of parties—especially those of mainstream² ones—on the performance of democracies in 24 EU countries.

We then develop a perspective that explains the empirical variation we observe in parties' evaluations. Our starting premise is that parties are vote seekers, either because they wish to become elected in order to pursue policies or for non-policy reasons³. On this basis, we consider two mechanisms of parties' *regime access* that influence their evaluations of institutions.

The first mechanism emphasizes the odds that a party will become the incumbent in the near future—what we term *governing prospects*. The better these prospects are relative to their competitors, the greater the odds that parties evaluate institutions positively because incumbency provides the means and opportunity supplied by institutions to implement policies and reward voters. How can a party tell the odds that it may be included in the next government? We suggest that two party-level characteristics enhance their governing prospects. First, one clear indication of their future success is how successful they have been in

²Throughout, 'mainstream' refers to ideologically moderate parties on the main dimension of competition.

³ Dalton, Farrell and McAllister 2011; Downs 1957; Robertson 1976; Schumacher, de Vries and Vis, 2013; Schumacher, de Wardt and Vis 2015.

the past: their prior governing record under a set of institutions. All else being equal, parties with a substantial governing record likely evaluate institutions most positively than parties that have rarely governed. These parties have a proven track record that a set of institutions does not prevent them from gaining access to governing institutions and thus they tend to prefer it over uncertain alternatives. Second, parties with extensive mass organizations should be more positive about their governing prospects than parties lacking effective organizations because mass organizations provide parties the resources needed to fight and win elections.⁴ In a word, then, parties' governing prospects—operationalized as parties' incumbency record and their degree of mass organization—should shape parties' stances on the performance of regimes regardless of the duration of a democratic regime, party ideology, and other controls.

A second mechanism conceptualizing regime access also emphasizes the electoral fortunes of parties but explicitly accounts for the dynamic consequences of parties' *regular* regime access for their institutional evaluations. The mechanism is a *habituation process*: long-term experience of democratic governance entails that mainstream parties learn that they have access to governing institutions some of the time.⁵ Viewed over multiple elections, an incumbent that loses one contest does not need to assume that the rules of the games prevent it from future regime access as long as it experiences some access to governing institutions. In short, viewed dynamically, habituation *moderates* the potential fallout of an election loss for a party's institutional evaluations.

⁴ Janda and Coleman 1998.

⁵ Dalton and Weldon 2007; Easton 1975; Linz and Stepan 1996.

While the governing prospects and habituation mechanisms both conceptualize the consequences of parties' regime access to institutions (or lack thereof), they capture different aspects of it. The governing mechanism focuses on the experience of individual parties *relative to all other parties* at a given point in time. It suggests that being a relatively successful party improves their regime evaluations regardless of a regime's duration and independently of other party-level traits. The habituation mechanism, in turn, explicitly takes time into account by focusing on the elasticity of this support when an incumbent loses an election. In this way, "loser's consent"⁶ among parties emerges via regular access to a political regime over time.

We do not suggest that political parties are *exclusively* office-seekers or that regime-access is the sole driving force of parties' evaluations of democracies. For example, the empirical analyses below show that parties in countries with poorly performing institutions tend to evaluate them more negatively. We interpret this as a sign that parties are to some degree motivated by the policy goals regarding the performance of national democracies. While this is important, it is a less revealing finding than what we show—namely that even controlling for the quality of institutions, and regardless of parties' general ideological centrism, the degree of regime access still influences mainstream parties' evaluations of the democratic performance.

We test four hypotheses derived from the governing and habituation mechanisms using two expert surveys that we conducted in 24 EU member-states in 2007/8 and 2013. We supplement this data set with information about parties' electoral success, as well as a range of country contexts, such as institutional and economic indicators.

⁶ Anderson et al. 2005.

Consistent with the regime access model, we find in our cross-sectional analyses that a party with a significant record of prior incumbency relative to other parties or one with a well-developed mass organization is considerably more positive about national democratic institutions. These results emerge regardless of the duration of a country's democratic experience, its economic and political performance and a range of party-level characteristics. In addition, over time, we find evidence suggesting that a change in incumbency between 2008 and 2013 leads to a much more muted change in performance evaluations in older democracies whereas the reduction is quite dramatic in newer ones. Finally, our analyses of parties' policy statements reveal one extreme case—the Hungarian party system—illustrating how in conditions of relatively weak habituation, a party that has very negative institutional evaluations in opposition (Fidesz) can become very positive about the performance of a national institutions if it is given access to it and therefore an opportunity to remake it. In short, regime access has a considerable influence on these stances even taking into account the country's "objective" performance and other party traits.

This summary highlights the need to know more about why parties are positive or negative about democratic institutions. According to our study, parties may be negative about institutions even if they work quite well, namely when they have limited access to the regime. They can also be quite positive about institutions even if the performance of democracies is poor, namely when they rule regularly. Neither scenario is ideal if the main goal is to strengthen the performance of democracy. In the former case, negative messages about a democracy's

performance may spawn a critical orientation among party followers;⁷ and in the latter scenario, parties may just be content to accept institutions that provide them with access—or even to focus on cementing their regime position—even though the performance of a regime is troublesome.

Party Stances on the Performance of Democracies

Most academic research has paid fairly little attention to the stances that political parties adopt on the performance of democracies, in stark contrast to the literature on popular dissatisfaction with the performance of democratic regimes.⁸ This gap is regrettable because we see numerous examples of critical parties. For example, British Liberal Democrats and Labour MPs hold strongly unfavorable views of the House of Lords as currently constituted.⁹ Green parties in Germany (and elsewhere) were at least initially unhappy with the focus of national elections in representative democracies.¹⁰ We observe more far-reaching efforts by the Bulgarian GERB to fight corruption,¹¹ and the periodic attempts by Italian elites to reform institutions.¹² As table 1 shows, we can find many cases in 2013 across Western and Eastern Europe of mainstream parties, in ideology and in terms of significant electoral support, that advance critical views of national democratic institutions. Clearly, critical parties are sufficiently

⁷ Of course, parties do not just lead; they also follow their supporters. How strongly each causal pathway runs is, however, unimportant for the purpose of this implication as long as we can assume that parties exert some influence over what followers believe.

⁸ E.g., Anderson and Guillory 1997; Anderson and Just 2012; ; Anderson et al. 2005; Bernauer and Vatter 2011; Canache, Mondak and Seligson 2001; Clarke, Dutt and Cornberg 1993; Curini, Jou and Memoli. 2012; Dalton 1999; Hobolt 2012; Schmitt and Thomassen 1999; Thomassen 2014; Wells and Kriekhaus 2006.

embedded and prevalent in both Western and East Europe to make them an important object of study. However, beyond specific country and party studies, there is little comparative evidence about how parties—especially mainstream ones—evaluate the performance of existing regimes. One goal of our study, therefore, is to systematically describe the way that parties evaluate the performance of a regime.

Table 1 about here

Explaining Party Stances

Another goal is to explain variance in how parties evaluate institutions via two mechanisms: parties' governing prospects; and their habituation to democratic governance.

Governing Prospects. We assume that politicians compete for public office in order to become elected, either for its own sake or to pursue policies.¹³ This assumption is backed by empirical research about the beliefs of campaign activists and MPs which shows that they typically want to win office.¹⁴ Accordingly, we suggest that parties' electoral prospects significantly shape their views on the performance on existing regimes. We argue that two factors help parties to identify the odds of governing in the near future: their record of past inclusions in governments; and their organizational capacity.

A first factor is an extension of the notion of winning an election: if parties have a cumulative record of incumbency under a set of institutions, then they have incentives to remain positive about a regime, all else being equal. This expectation follows directly from the idea that parties want to win elections and the more often they have done so in the past, the

¹³ Aldrich 1995; Downs 1957; Robertson 1976; Strom 1990.

¹⁴ Bowler, Donovan and Karp 2006; Zieman 2009.

more they can be assured that the existing rules will serve them well again in the near future. The mechanism is that incumbency provides parties with access to the regime via ministerial portfolios that provide the basis for policy implementation, by extracting resources from the state (“cartels”), or by using administrative posts to satisfy specific clienteles. In turn, parties lacking a significant incumbency record are more likely to be critical of institutions, regardless of the democratic character of a regime or its duration. Note that the mechanism here stresses the incumbency record of parties relative to each other; we will below consider the link between democratic longevity and regime access. Thus, recurring incumbency relative to other parties matters as much as their current governing status.¹⁵

Hypothesis 1: Parties with a record of prior incumbency relative to other parties are more positive about institutions than parties that lack this record, independently of other factors.

Another party-level factor that we argue helps parties to gauge their governing prospects is their organizational capacity. Mass organizations are usually better equipped to attract diverse voters than parties that lack this capacity, both in the more mature democracies of Western Europe¹⁶ and newer ones in Central and Eastern Europe.¹⁷ There are multiple mechanisms that link party organizations to their electoral success. Historically, mass parties made possible the integration of wide swaths of newly enfranchised voters into the democratic process by mobilizing individuals during election campaigns, communicating with voters between elections, and forging linkages to other social groups from similar social milieus.¹⁸

¹⁵ Rohrschneider and Whitefield 2016; Schumacher, de Wardt and Vis 2016.

¹⁶ Janda and Coleman 1998; Rohrschneider and Whitefield 2012.

¹⁷ Evans 2006; Tavits 2013.

¹⁸ Boix 1999; Dalton and Wattenberg 2000; Lipset and Rokkan 1967.

Empirically, one study finds with data from the late 1950s and early 1960s that parties with mass organizations obtain more electoral support than parties lacking this capacity.¹⁹ While some authors conclude that mass parties have disappeared because of membership decline, new forms of campaigning, or the decline of party-voter linkages,²⁰ other analyses present evidence that mass organizations continue to be crucial in attracting diverse voters to this day.²¹ In addition, in our own analyses, we found a strong relationship between electoral success and organizational capacity.²² All else being equal, we suggest that parties with mass organizations should have greater governing prospects and thus should be more positive about the performance of existing institutions.

Hypothesis 2: Parties with mass organizations are more positive about existing regimes than parties without mass organizations regardless of their party ideology and regime duration.

Democratic Habituation. The habituation model posits a mechanism whereby mainstream parties within a given country become integrated into a regime over time and thus evaluate democratic institutions positively regardless of their governing prospects. The habituation perspective is cogently expressed by Linz and Stepan:²³

“Constitutionally, democracy becomes the only game in town when all the actors in the polity become habituated to the fact that violations of these norms are likely to be both ineffective and costly. In short, with consolidation, democracy becomes routinized and

²² See Rohrschneider and Whitefield 2012, chapter 6. In 2008 (2013), the relationship is $r=.52$ ($r=.34$) in CEE and $r=.64$ ($r=.45$) in WE.

²³ Linz and Stepan 1996,5.

deeply internalized in social, institutional, and even psychological life, as well as in calculations for achieving success.”

This perspective is supported by a large literature on elite (and mass) socialization which shows that political actors tend to internalize institutional norms over time, both at the level of nation-states²⁴ and at the level of the European Union.²⁵ David Easton similarly conceptualizes the development of diffuse regime support—defined as an “attachment to political regimes for their own sake”²⁶ on the basis of both “socialization...and direct experience...with performance”.²⁷

There are then two pathways for elites and parties to come to endorse democratic regimes: democratic learning and exposure to the positive performance of democratic regimes. Thus, one possibility is that most parties in a durable democracy are more positive about a regime than parties in newer democracies.

Hypothesis 3: Independently of their electoral prospects, parties competing in older democracies are more positive about the performance of a regime than in newer democracies.

Additionally, the habituation argument may unfold its influence primarily over time via a party’s regime access. In durable democracies, parties with a longer record of incumbency can rely on memories of victory in defeat. In newer regimes, in contrast, losing parties have fewer memories of re-emerging victorious in subsequent elections. The idea of “loser’s consent”²⁸ at the party level means that regime duration influences parties’ reaction to an election loss in the

²⁸ Anderson et al. 2005.

immediate past election. When election losers had a chance to experience over time that they need not fear a permanent exclusion from governing institutions, their views of a regime's performance, all else being equal, should remain more positive than when parties lacked this experience. If this dynamic argument applies, a *change* in status from government to opposition in a newer democracy should relate to a more significant drop in regime evaluations than in long-lasting regimes.

Hypothesis 4: A change in incumbency status leads to a more noticeable reduction in regime evaluations in newer democracies.

Measurement

We use two expert surveys conducted in 24 European nations in 2013 and 2008²⁹ which cover all EU-member-states as of January 1, 2014 (except Croatia, Cyprus, Luxembourg, and Malta). Given the significant number of small parties that exist in many party systems, we use two criteria to determine their inclusion in this study: (1) they are represented in a national parliament; (2) and they received at least 2% of the national vote in the last election. Overall, the 2013 (2007/2008) CEE survey covers 71 (72) parties in 10 EU member-states in CEE; and the WE survey covers 108 (114) parties in 14 countries, for a total of 179 (186) parties in 24 nations. On-line appendix table A1 lists the parties and countries included in the surveys, along with the number of experts for each country.

²⁹ The 2008 survey took place in the fall of 2007 (in CEE) and spring of 2008 (WE); the 2013 survey took place from February 2013 to January, 2014.

We recruited experts from a master list of scholars who published a peer-reviewed article or book on her party system in the past ten years. Our search generated a list of names with over 1000 experts. For each country, we aimed to have ten completed questionnaires which we achieved for most countries (on-line appendix). We conducted several analyses following Steenbergen and Marks and Coma and van Ham³⁰ to check whether the variance decomposition of indicators in our expert surveys parallels that found in other expert-surveys.³¹ To measure how parties evaluate the performance of democracies, one question asks experts:

“What about the party’s view of how well democracy works in [country]? Do parties hold positive (7) or negative views (1)?”

In line with our theoretical interests, the indicator focuses on the way democracies work. It does not gauge constitutional ideals (e.g., are parties committed to democratic principles); neither does it center on the policy performance of a single government. In contrast to the Chapel Hill surveys, which stress the positions of a party’s leadership, we felt that the image of the entire party is important even if there are intra-party differences between leaders and activists (or voters). Theoretically, this may introduce slight differences in expert judgments. Practically, however, this nuanced variation in the question wording in the two expert surveys seems to have had little effect on the estimates produced by each survey when nearly identical indicators are available. Merging the 2014 Chapel Hill estimates with our 2013 data, we find that, on general left-right ideology, estimates for party positions are virtually

³⁰ Coma and van Ham 2015; Steenbergen and Marks 2007.

³¹ Supplementary index 1 unpacks the variation of expert-level responses into expert, party, and country-level variances. Supplementary index 2 suggests that the variance of expert-level responses is related to parties’ clarity of stances but not to country-level factors like and other party-level traits. These analyses closely produce variance patterns reported by Coma and van Ham (2015) and Steenbergen and Marks (2007).

identical in the two surveys ($r=.97$). The UNC cultural position indicator (“Gal-Tan”) is also closely related to a cultural issue indicator based on migration, social policies, and civil liberties in our expert surveys ($r=.93$). Finally, we find a strong relationship regarding parties’ position about European integration ($r=.93$).³² All told, these patterns suggest that these different expert surveys produce broadly identical estimates for party positions.³³

Another issue with our indicator is that experts may have evaluated the position of parties based on the performance of the incumbent government not the entire regime. To some degree, this overlap is appropriate when corrupt governing parties reflect the quality of the entire regime. However, analyses of mass satisfaction with democracies also show that the economic performance of incumbent governments influences popular evaluations of democracies.³⁴ Analogously, it is possible that the policy performance of the current government influences experts’ assessment of how parties evaluate the performance of a regime. We deal with this possibility by including several indicators about countries’ economic conditions, along with party positions on left-right policy issues and the governing status of parties (discussed below). Controlling for these variables means that the theoretically relevant

³² For details on measurement of these indicators, see either the UNC codebook or the information presented in (Rohrschneider and Whitefield 2012, chapter 1).

³³ One might also hypothesize that the party focus in our question may result in greater uncertainty among experts about the performance indicator when parties have mass organizations and where, accordingly, experts have reasons to be uncertain about which stratum (voter, activist, leader, etc.) to stress in their response. This uncertainty may be lower for populist parties where a charismatic leader more strongly shapes the programmatic image of parties. However, we find virtually no relationship between the standard deviation of expert responses about the performance of regimes and parties’ degree of mass organizations ($r= -.01$ in CEE; $r= -.02$ in WE). We interpret this—along with the strong relationships with UNC indicators—as evidence that the lack of leadership focus in our questions introduced little uncertainty among our experts.

³⁴ E.g., Hobolt 2012; Thomassen 2014.

predictors (also developed shortly) explain how parties evaluate the entire regime as assessed by experts.³⁵

In an attempt to validate the indicator, figure 1 presents evidence that meets our general expectations in light of prior knowledge. The y-axis of in both figures displays the average regime evaluations of parties in each country. The x-axis in the top figure arranges countries on the basis of World Bank scores of institutional quality (corruption, rule of law, voice and accountability, and government effectiveness).³⁶ The patterns square nicely with the accounts from country studies and impressionistic evidence—parties in systems with higher institutional quality, on the whole, are quite positive about the performance of national regimes (e.g., Scandinavia and the Netherlands). And where institutional quality is lower (e.g., Bulgaria, Romania, and Greece), we see that parties on average are the most negative about a regime. The bottom figure, in turn, indicates that mass publics on average agree with the average stances adopted by parties. The x-axis in the bottom figure arranges countries on the basis of the mean mass satisfaction of democracies (based on the 2012 European Social Surveys). The figure shows that parties and mass publics broadly agree in their evaluations of

³⁵ A further concern about the indicator is that the meaning of 'how well democracy works' ascribed by experts may vary across countries. Certainly, there exists some variation in the nature of democratic institutions across countries as with democratic quality. We include controls for some of these differences in the models. However, in practice the institutional arrangements are sufficiently similar across the region that experts are not making judgements in radically divergent contexts. What is more, citizens and elites share a broad understanding of liberal democratic rights (Oshri, Sheaver, and Shenav 2016) which further reduces substantial variations in the way democracies work in Europe. As for the unspecified content beyond this shared understanding, we would argue that it makes it possible to broadly compare voter positions across countries as parties, just as the unspecified left-right indicator facilitates a comparison of publics' ideological orientation cross-nationally (Dalton, Farrell and McAllister 2011).

³⁶ We checked the validity of the World Bank data by adding several institutional quality indicators from the Varieties of Democracy data set (Coppedge, Lindberg and Skaaning 2015). As supplementary index 3 shows, there is a very high correlation between the WB and a summary index of the VoD quality indicator ($r = .87$). Given the overlap, we find, expectedly, that none of the results presented in this study are influenced by the choice of data source.

democracies at the national level ($r=.73$). These patterns suggest that we have a reasonable measure of party stances on the performance of democracies.

Figure 1 about here

But country averages mask considerable variation across parties—the central focus in this study. Figure 2 describes the party-level patterns in light of our discussion about the degree to which parties from various ideological locations evaluate regimes positively or critically. On the y-axis, the figure presents parties' regime evaluations whereas the x-axis displays their ideological location (as perceived by experts) on a left (1) right (7) scale (see the online measurement appendix for the question wording). The figures also include squared fit lines to illustrate whether ideological extremism relates to their regime messages. We find a large number of parties - 91 of 179 parties in the data set - that are critical of the performance of national democratic institutions, defined as a rating of less than 4 on a seven-point scale where 7 means a positive assessment. While many of these parties have only minor levels of electoral support, even when the bar is set at having achieved over 10% of the vote in the previous national election before the survey, there are still 31 parties that are highly critical.

Figure 2 about here

We also note that the way parties evaluate institutions is directly linked to their ideology in WE. This is as we would expect as extreme parties often adopt ideological stances that can be either on principle antithetical to democracy or that are radically more demanding about greater levels of democracy. We therefore see a marked curvilinear relationship in the bivariate scatterplot, with the ideological extremes at the left and right polar end adopting

much more critical stances than parties in the ideological center.³⁷ Several extremist parties are quite critical of the existing democracy, e.g., the Spanish separatist AMAIUR, the German Linke party, but also the French right-wing FN, the Belgian VB and FN, and Geert Wilder's party (PVV) in the Netherlands. In contrast, many parties in the ideological center are quite positive about a regime, including the German CDU and CSU, the Irish Fianna Fial (FF), the Scottish SNP, and the Finish KOK. However, we also note that some parties in the ideological center can be quite negative as well, such as the newly founded Italian protest party M5S or the Dutch D66, suggesting that ideology is likely only part of what shapes performance evaluations.

The patterns in CEE are different, however. For one, the overall relationship between ideology and regime evaluations is nearly flat.³⁸ We can see, for instance, that parties with a critical stance include a number of communist and nationalist parties but also more mainstream parties such as the liberal EGYUT and the social democratic MSZP in Hungary, the Polish Civic Platform (PO), along with the centrist DESUS in Slovenia. In turn, we find positive evaluations among mainstream parties, such as the liberal RE and conservative Pro Patria (IRL) in Estonia, but also Fidesz. There is, in short, little evidence that mainstream parties are more positive than extremist parties in newer democracies. As our previous research has shown³⁹, this is not because of an overall absence of ideological underpinnings to party stances in CEE countries. Rather, we interpret the lack of association of extremism and institutional evaluations in CEE countries in light of our broad theoretical approach. No doubt democratic

³⁷ These patterns help to validate our indicator as we clearly see right-wing parties (e.g., the Belgian VB and FN, the Austrian FPÖ, and the now defunct Dutch Verdonk) agreeing with such parties as the German Linke in their negative stance about regimes.

³⁸ A bivariate model with the main and quadratic ideology variables explains over 20 percent of the variance in WE. In contrast, the model explains nearly exactly 0 percent of the variance in CEE.

³⁹ Rohrschneider and Whitefield 2009.

institutions in the East are of lesser quality in performance than in the West and that gives all parties policy-driven reasons to be critical of them, even parties that may support democracy in principle. But as important from our theoretical perspective is the fact that (i) CEE parties in these new democracies, including those at the ideological center, lack the moderating influence of habituation to democratic institutions through repeated regime access and (ii) the consequences of losing and winning in CEE party systems can be much greater for institutional evaluation than in WE, including for centrist parties. The confluence of these factors—lower quality, lack of long-term access across the board—means that parties at the extremes and mainstream can evaluate the performance of democratic institutions negatively.

--Figure 2 about here--

Multivariate Analyses

What explains this variation across parties? Our theoretical argument suggests, first, that parties' governing prospects significantly influence their regime evaluations. One indication of parties' governing prospects is how often they have had access to governing institutions in the past (H1). Accordingly, we created a new variable measuring how many years a party participated in a government since 1945 or a later year if a country democratized post-1945 (e.g., Germany, Greece, Portugal, Spain, and CEE countries).⁴⁰ To standardize this variable across nations with different democratic regime duration, we divided the length of parties' government participation (counted in years) by the total number of years that a country was

⁴⁰ For most parties and countries, this turned into a straightforward exercise. Italy, however, proves to be a difficult case because it experienced high degrees of discontinuity in party organizations and institutions. To assess the robustness of the results, we excluded each country on a one-by-one basis from the estimation of coefficients presented in table 1 and also re-computed the predicted values presented in figure 3. These analyses indicate that the results remain virtually identical to those presented on the basis of the entire set of countries.

democratic since 1945. Accordingly, the measure captures how well parties fare compared to their competitors; it does not reflect regime duration which we will measure separately (see below).⁴¹ For example, by 2013, the German SPD had participated in a German government for 27 years. This amounts to 42 percent of all years since 1949.⁴² Our expectation is that a stronger governing record improves evaluations of a regime's performance.

A second measure of parties' electoral prospects focuses on their ability to attract voters through their organizational capacity. We constructed an index based on four questions from the 2013 expert survey to measure this concept. Two items tap the importance of members and the party apparatus in shaping the policy positions of parties.

"Would you please estimate the extent to which each 'face' of the party is strong in determining party policy?"

Respondents rated the importance of a "party membership" and the "party apparatus" in shaping party policies. Experts use the response categories ranging from "1" (unimportant) to "7" (very important). A third question asks whether parties have a significant membership base:

"And does the party have a 'significant' membership base in terms of numbers? We realize that the determination of a 'significant membership base' is somewhat arbitrary

⁴¹ Since the measure of prior governing record controls for time, the relationship between this indicator and length of democracy (see below) is weak ($r=.13$).

⁴² A concern with this measure may be that experts use the governing record of parties to evaluate how parties assess the performance of a regime. At least two reasons allay this concern. First, if this were generally the case, then we would expect experts to use parties' governing record in Central and Eastern Europe. However, we see that there is nearly flat line in figure 2. Second, when we replace the national democracy indicator with one measuring party stances about the performance of the "EU regime", a parties' governing record is insignificant in the East *and* the West. Surely, if experts used parties' governing record to assess their performance evaluations of institutions, then this should be especially the case for the performance of the EU.

and may vary from country to country depending on its population. Our main concern is to distinguish between parties that have few members and those that relatively large numbers of members. (“Yes” or “No”).

A fourth indicator gauges how many affiliations parties have with social groups:

“Does the party have an organizational affiliation with any interest group or civil society group, such as trade unions, business associations, church groups, etc.?” (Response categories are “Yes” or “No”).

Together, these indicators measure whether parties have significant membership levels, an elaborate party apparatus, and linkages to other social groups. We first re-scaled all variables to have a minimum of “0” and a maximum “1” and then created an additive index which has a theoretical minimum of 0 (if no expert saw a party having any of the four characteristics) to 4 (if all experts saw all traits in a party).⁴³ Practically, the range is from .25 to 3.3 for parties in CEE (with a mean of 1.84); and a range of .02 to 3.6 for parties in WE (with a mean of 1.91).⁴⁴

Lastly, based on the research literature, on mass evaluations of the performance of democracies, we include several control variables. One argument about an individual’s regime evaluations likely applies to the party level as well—the political and economic performance of regimes surely influences parties’ regime stances. Politically, prior opinion research suggests that the quality of institutions—low corruption, the rule of law, independent bureaucracies,

⁴³ Cronbach’s alpha=.71 (West) and alpha=.74 (CEE).

⁴⁴ We validated this indicator with Katz and Mair (1992) and our own data.. To this end, we translated the qualitative information in the Katz/Mair handbook into numeric indicators. The summary indicators for mass organizations based on Katz/Mair and expert data are reasonably strongly linked ($r=.63$; $N=29$), despite the fact that there is least a 20 year time lag between both studies, and the very different modes of data collection.

and fair elections—influences the way that political actors evaluate institutions.⁴⁵ A straightforward extension is that under-performing institutions (e.g., those with higher corruption levels) lower parties' average regime evaluations, all else being equal. The variable partially controls for parties' policy-goals at the country level—when institutions under-perform, then parties concerned with the development of democratic institutions become more critical of them, either by demanding more democracy or opposing democracy *per se*. Similarly, as mass level studies suggest that poor economic performance of regimes lowers mass satisfaction with the performance of democracies, we expect a similar effect among parties, such that higher unemployment and inflation rates lower parties' evaluations of a regime.

Next, we control for the extent of majoritarian political institutions, using Lijphart's executives-parties dimension.⁴⁶ Here we consider the possibility that proportional institutions, which maximize the access of multiple parties to regime institutions, receive better performance marks from parties than majoritarian institutions.⁴⁷ What is more, we also examine the possibility that the consequences of parties' regime access are moderated by the institutional environment. When more parties have a chance to enter parliaments and to influence policies, they may be less negative about these institutions, all else being equal. We remain agnostic whether this effect emerges because we can also imagine a scenario whereby

⁴⁵ Bernauer and Vatter 2010; Norris 2014; Sanchez-Cuenca 2000.

⁴⁶ We focus on this dimension because Lijphart excludes the second (federal-unitary) dimension when analyzing the consequences of institutions for policies (Lijphart 2012, p. 256). We checked the influence on regime evaluations and it is insignificant.

⁴⁷ Anderson et al. 2005; Bernauer and Vatter 2014; Lijphart 2012.

parties are equally happy to govern unrestrictedly for limited periods, in which case majoritarian systems may not be viewed more negatively by parties.⁴⁸

At the party level, we control for parties' current governing status because current incumbents may for the time being be happier with the performance of the current regime than losers of the last election, just as at the level of mass publics supporters of incumbent parties are more satisfied.⁴⁹ Similarly, we include their popular support in the last election prior to our surveys. We control for party ideology by including the main and squared terms in the multivariate analyses because the descriptive patterns in figure 2 show that the extremes are more negative about institutions in WE than in CEE. Since prior research also shows that party competition in newer democracies in CEE is often clientelistic⁵⁰ - meaning that electoral losses may lead to a clear-out of parties' clients in state administration - we include an indicator from the expert surveys which measures whether parties target specific constituents with their appeals. Given the high organizational turnover of parties in CEE and South-Western Europe, we included a "stable party" indicator because stable parties may be more positive about a regime than those that formed recently in response to new events (e.g., the economic crisis).⁵¹ Lastly, additional analyses by East-West regions (supplementary Index 4; see also the conclusion) suggest that two Hungarian parties—Fidesz and the MSZP—are clear outliers so we include a dummy variable for each party. We will provide a substantive interpretation for this

⁴⁸ Updated data for Lijphart's executive parties dimension for all 24 countries in our study is taken from Vatter and Bernauer (2009).

⁴⁹ Anderson and Guillory 1997.

⁵⁰ Kitschelt et al 1999.

⁵¹ To create this variable, we coded every party in our 2013 data that emerged since the beginning of the crisis in 2008 as a new party. This shows that 31 percent of parties are new in CEE; this proportion is lower in WE (17 percent).

pattern below so we just note here that they are extremely positive (Fidesz) or negative (MSZP) in 2013, respectively, which affects the pattern in CEE.

Results. Model 1 in table 2 confirms that most of the variance of party stances is located at the party level. The empty random intercept model, where parties are nested within countries, shows that only about 9 percent of the variance is located at the country level; about 91 percent of the variance occurs at the party-level. This confirms our approach to explaining the empirical diversity by considering the characteristics of parties in addition to those at the country-level such as the performance of regimes.⁵²

Table 2 about here

Model 2 shows that a party with a significant governing record in postwar decades has a statistically significant influence on regime evaluations.⁵³ Substantively, when we consider a change in governing record from one standard deviation below the mean (0) to above it (.5), performance evaluations in the West improve from 3.6 to 4.5; and they improve from 3.2 to 3.9 in CEE. By comparison, moving from one standard deviation below the ideology mean to above relates to a change from 3.5 to 3.7 in CEE and from 3.8 to 4.2 in WE. In other words, having a significant governing record has a stronger effect in both regions as moving from ideologically

⁵² One might argue that experts focus on parties within countries and therefore underestimate the importance of country conditions. However, when we partition the variance of parties' left-right ideology in the manifesto data, which are also included in the expert survey, into country and party-level variance, we find nearly identical variation: 10 percent of variance is located at the country level; ninety percent at the party-level.

⁵³ We tested whether two variables of theoretical interests—party ideology and proportion in postwar governments—vary randomly across countries. We therefore compared the fit of the model without random effects (as in model 2) with one that includes random coefficients (model results not shown). A likelihood ratio test suggests that model 2 fits the data as well as a model that allows the two parameters to vary randomly (chi-square=.24; p= .89).

leftist to ideologically rightist parties. When we add an interaction term between the regional dummy (East vs. West) and parties' governing record, the interaction term is insignificant suggesting that this effect is relevant in both the East and the West (not shown in table 2; also see supplementary index 4 and the discussion below). Note that parties' governing record reaches significance in all models regardless of which (and how many) contextual factors we include in models 3-7. In short, parties' prior incumbency record is a statistically and substantially relevant influence on parties' stance on the performance of democracies.

Another consistent pattern across all models is that the indicator for mass organizations is highly significant. Substantively, the influence is as strong as that of a prior governing record: when we move from one standard deviation below to above the mean, performance evaluations in CEE increase from 3.1 to 3.9; and from 3.7 to 4.5 in WE. Evidently, parties with stronger mass organizations are considerably more positive about a regime regardless of a party's ideology and prior governing record. What is more, this finding remains intact once we add country-level characteristics (models 3-7); and we again find that this effect is highly significant in both CEE and WE.⁵⁴

Crucially, these findings emerge after controlling for a range of other significant party characteristics, in particular parties' ideological extremism is statistically significant in the pooled data. Additional analyses confirm (as figure 2 suggests) that this pattern is primarily driven by the relationship in the West and not the East.⁵⁵ We also find that current government status increases evaluations of a regime; this parallels the findings from mass publics that

⁵⁴ The regional analyses show that this variable is highly significant at the $p=.01$ level (supplementary index 4).

⁵⁵ In another model (not shown), we tested this by including an interaction between the ideology (squared) and the regional dummy. As in figure 1, the marginal coefficients show that the ideological extremes are more negative about a regime's performance in the West but not in CEE.

winners of the immediate past election trigger positive performance marks for a democratic regime).⁵⁶ Finally, there is some evidence that parties with clientelistic ties are a bit more negative about a regime—but the results are marginally significant and, moreover, do little to reduce the influence of theoretically focused predictors.

On the whole, the party-level model fits the data quite well as we observe that the residual variance in the empty model 1 (2.03) is considerably higher than in model 2 (.77)—this amounts to a 62 percent reduction of the variance at the party-level (Hoffman 2015). All of this suggests that these party-level traits make a significant contribution to explaining their regime evaluations.

Adding Context Indicators. Models 3-7 now add theoretically informed contextual variables. To test the direct influence of the habituation model on regime evaluations (H3), model 3 adds the number of years that a country has a democracy score of 8 or higher in the polity IV data set since 1945.⁵⁷ In order to control for socio-economic conditions, all models control for GDP/capita, inflation rates, and unemployment levels (measures taken from 2012). We include the World Bank's institutional quality measure in order to consider the influence of the "objective" institutional quality on performance evaluations. For reasons discussed earlier, we include Lijphart's recently updated parties-executive dimension (Lijphart 2012, chapter 14). We added the central contextual variables one-by-one in order to document the robustness of results regardless of model specifications.

⁵⁶ Anderson and Guillory 1997.

⁵⁷ The results are not sensitive to lowering the cut-off points; neither does setting the UK to an earlier year.

Model 3 shows that length of democracy has no direct influence on parties' stances ($p=.32$), providing no support for H3, a finding that emerges in all models. In turn, model 4 adds a country's institutional quality indicator along with economic performance variables. The results confirm that parties competing in nations with higher institutional integrity are decidedly more positive about a regime regardless of national economic conditions.⁵⁸ This pattern may partly result from the policy-motives of parties (they care about the performance of domestic regimes) and partly supports the regime access mechanism as institutions with low integrity unfairly bar some from accessing the regime. Note that despite this control, governing record and organizational traits remain significant. Model 5 includes both regime duration and institutional quality. Despite their overlap ($r=.80$), institutional quality emerges as the dominant factor. As a robustness check for the direct effect of regime duration, model 6 uses government turnovers since 1945 as an alternative indicator for habituation because alternations in governments feature prominently in the model about institutional learning.⁵⁹ Again, there is no evidence that government turnovers directly influence the stances that parties take on the performance of a regime—the coefficient is insignificant regardless of model specification; and model fit does not improve.

We also note that Lijphart's executives-parties dimension fails to reach statistical significance in any model, which means that the openness of institutions to parties does not

⁵⁸ Recall, though, that only 9 percent of variance is located at the country level.

⁵⁹ Easton 1975. On the basis of a new data set (Ieraci and Poropat 2013), we added information about all democratic government changes in Europe beginning in 1945 (if a country was democratic) or later if not (see also Ieraci 2012). Because the Baltics were omitted from this study, we used the same criteria to code government turnovers for the Baltics ourselves so that we have turnover data for all 24 European countries. We thank (name withheld) who provided us with information about Baltic governments from 1990 to the present. The relationship between democratic regime duration and government turnover data is $r=.59$.

directly influence parties' performance evaluations. As a final test, model 7 considers whether the executives-parties dimension moderates the influence of prior governing experience. While the coefficient just fails to reach statistical significance ($p=.06$), the marginal coefficients indicate that the influence of prior governing is modestly larger in proportional regimes (supplementary index 5). However, the confidence intervals of marginal coefficients indicate that the influence of prior governing experience is significant in nearly all but the most proportional regimes and the coefficient's confidence intervals overlap suggests that there is no significant difference across the executives-parties dimension. None of the other predictors measuring regime access is moderated by the executive-parties dimension.⁶⁰

Finally, we note that three of the four contextual control variables connect to parties' regime stances as expected based on prior research. Higher inflation rates relate to lower regime evaluations and higher unemployment tends to reduce regime evaluations (though this variable does not reach statistical significance). In contrast, higher income levels have little influence on parties' performance evaluations.

All told, the two overarching theoretically relevant findings are that the two party-level variables measuring governing prospects—incumbency record and mass organizations—predict party stances on the performance of democracies in statistically and substantively significant ways. In contrast, we see no evidence in support of a direct influence of regime habituation on parties' stances.

⁶⁰ All interaction terms are statistically insignificant when we include one between the executives-parties dimension and past electoral success ($p=.20$); governing status ($p=.29$), and mass organization ($p=.64$).

A Dynamic Perspective. The fact that the cross-sectional influence of regime duration is insignificant means that exposure to the performance of democracies alone does not enhance parties' evaluations of a regime. A clear implication is that even mainstream parties do not improve their regime evaluations by virtue of exposure to democratic practices, thus undercutting a straight aggregation of a learning argument from elite research to the party context. However, our discussion of the dynamic relationship between habituation and governing prospects provides a more subtle mechanism through which habituation can affect parties' regime evaluations (H4): parties that have been voted in-and-out of office *regularly* may learn that losing an election does not mean the end of their access to a regime.

To test this hypothesis, we merge the 2013 data with another data set from a 2007/2008 expert survey we conducted in the same countries with an identical expert questionnaire (see on-line appendix table A1). Naturally, a comprehensive test of the dynamic argument requires longitudinal data covering multiple changes in governments and multiple measures of parties' regime evaluations. While a full analysis of this sort is beyond the scope of our data containing two time points, an implication of H4 is that a *change* in governing status between 2008 and 2013 correlates with a change in parties' regime evaluations *especially* in newer democracies. The bivariate patterns clearly support H4: a loss of governing status correlates with a substantial reduction in performance evaluations in newer democracies (i.e., since 1990) across the two time points on the seven-point indicator ($d = -1.54$). In contrast, when regimes have been democracies since 1945, this reduction is considerably more modest ($d = -.43$; see the figure in supplementary index 6).

However, do these bivariate changes emerge primarily because extremist parties were ousted between the two surveys, like the Belgian Vlaams Belang and the Slovenian Conservative party (NSI), or because of the dramatic turnover in Hungary? Do we observe the change primarily in countries with severe fiscal problems where a change in government may coincide with a general decline in trust in the performance of national institutions across all parties as in Greece and Spain?⁶¹ Alternatively, do non-crisis countries experience steep declines in evaluations of the performance of democracies? To control for these possibilities, we conducted a multi-level analysis of the panel data. We deal with the statistical complexity resulting from the panel data by estimating a multi-level model where the observations per time point are nested within parties which, in turn, are nested within countries.⁶² In order to disentangle the impact of a change in parties' incumbency status on a change in performance evaluations from pre-existing cross-party and cross-country differences in performance evaluations, this analysis requires the inclusion of variables about incumbency at each level:⁶³ one variable captures the *within-party* change in incumbency status (i.e., this captures the impact of a change of status across time within parties on their performance stances); a second variable captures the average cross-party differences in incumbency status (i.e., some parties are never incumbents others nearly always); a third variable captures the country-mean scores of the incumbency variable (e.g., some countries have only few parties ever gaining access to governing institutions). The inclusion of information about incumbency at the three levels in the multi-level model means that the coefficient for the original incumbent dichotomy now

⁶¹ Roth, Nowak-Lehmann and Otter 2013.

⁶² Hoffman 2015.

⁶³ Hoffmann 2015, chapter 8.

captures the extent to which a *change* in incumbency relates to changes in performance evaluations between 2008 and 2013, controlling for cross-party differences in incumbency and country dependencies.⁶⁴

The analysis also includes an interaction term between the within-party change variable and the length of democracy indicator which we centered at 1945⁶⁵ because H4 stipulates that incumbency changes have an especially strong influence on performance stances in newer democracies. We include indicators about ideological extremism variable (main and squared terms) and a dummy variable capturing crisis countries (Greece, Italy, Ireland, Portugal, and Spain).

Table 3 shows the model results. The interaction term is statistically significant ($p=.04$) suggesting that a change in incumbency status between 2008 and 2013 significantly alters a party's performance evaluations of a democratic regime net of other factors. Figure 3 illustrates that the changes are especially noticeable in newer democracies. Note that this result holds regardless of cross-party differences in incumbency which also strongly influences performance evaluations ($b=1.15$). To reiterate, we do not wish to overly emphasize these dynamic patterns given our short time series. But this evidence does support the argument that the negative effect of an election loss for regime evaluations is tempered by habituation even when we control for extremism and crisis context.

Conclusion

⁶⁴ Ibid.

⁶⁵ We centered the variable so that the main effect of the incumbency variable reflects the changes for countries that have been democracies since 1945.

Prior research has produced a large number of mass opinion studies about how citizens evaluate democracies, but ours is one of the first that moves this question to the level of political parties. We find considerable variation in regime evaluations across parties and, to a lesser degree, countries. We suggest a *regime access* model whose two mechanisms capture the way that party and country-level conditions influence their evaluation of national institutions. The results from the cross-sectional analyses suggest that a record of incumbency across all prior elections (since 1945) provides victorious parties with the confidence that they have a reasonable chance to succeed again, thus boosting their evaluations of a democratic regime even if they currently constitute the opposition. In turn, those parties that have had few chances to become incumbents are likely to be critical of national institutions even if they work well (e.g., low inflation rates or low levels of corruption). This conclusion applies not just to smaller, extreme parties but extends to several centrist parties as well—and the pattern emerges in newer and more mature democracies. Thus, one important finding of our study is that when regular regime access is absent, the incentives for permanent election losers to positively evaluate institutions are fairly dim *even in a mature democracy*.

From one vantage point, a positive implication of this research concerns our analysis of mass party organizations. In Western Europe, the fact that they are associated with more positive democratic evaluations suggests that they continue to remain a pillar of liberal democracies, despite the 'demise of party organization' literature. In newer democracies, in turn, our findings suggest that mass organizations may grow into this role as others have argued⁶⁶ and if they do so may actually help boost the support for a democratic regime.

⁶⁶ Tavits 2012; 2013.

Another important finding is consistent with a moderating influence of habituation: election losses lead to a less dramatic reduction in regime support the longer a democratic regime has existed. Viewing the cross-sectional patterns from a dynamic perspective, then, suggests that a loyal opposition forms mainly when parties can realize that their governing prospects are reasonable *over time*. We must remain tentative about this conclusion because we only have two time points at our disposal so this is clearly one area where more research is essential. But in this regard, the cases of two Hungarian parties, MZSP and Fidesz, are highly illustrative of the possible negative consequences for democratic institutions when parties lack the moderating impact of habituation. The former party when in office at the time of our 2007 survey was broadly positive about national democratic institutions (mean=4.86). On losing office, however, and faced with Fidesz in power, its evaluation fell to the lowest possible value on our scale: mean=1.0. Fidesz, by contrast, shifted from a highly critical position in 2007 when in opposition (mean=2.13) to the maximally positive position in 2013 when in power: mean=7.0. The switch in governing status and in democratic evaluations of these parties is matched, of course, by dramatic changes in the Hungarian constitution, in ways that many regard as motivated by the pursuit of partisan advantage by the current Fidesz incumbents. Our approach would lead us to think in a similar way about the victory of PiS in Poland: from being a highly critical party of national institutions in 2013 (mean=2.27), we expect that its victory in 2015 and subsequent reshaping of democratic institutions will have led to a shift to much more positive evaluations on its part – but *much more negative ones* on the part of many other parties. These two cases illustrate how quickly major parties can switch their views about

the performance of institutions in newer democracies when parties lack regular access over time.

But we also see signs for concern in more stable democracies resulting from the potential effects on democratic evaluation of the growing fragmentation of Europe's party systems. This phenomenon is worrisome because it may shrink the pool of parties that remains positively predisposed about a regime on the basis of its regime access. Clearly, a greater number of party competitors may mean that fewer have regular access to a regime, all else being equal. During the post-war decades, democracies in Western Europe have relied on a handful of parties that regularly alternate between government and opposition which had the opportunity to accumulate a significant record of governing participation and, moreover, experience over time that a single election loss does not mean their permanent demise. If more parties never win and fail to acquire governing experience, the likelihood is on our evidence that their evaluation of democracy will decline, and demands for institutional change will grow.

Finally, we return to one implication of the results of 'critical parties' for the literature on 'critical citizens'. While critical citizens evaluate democracies negatively for a range of reasons, including their preference for more democracy, we show the circumstances under which parties might be critical of democratic institutions as well.⁶⁷ One simple but important implication is that if both publics and political parties evaluate a regime negatively, then we would anticipate more demands for regime changes regardless of the underlying motives –

⁶⁷ Additional analyses (supplementary index 7) suggest that our results do not just stem from a commitment of parties to democratic ideals which they articulate by evaluating the performance of democracies negatively.

either positively for better democracy or negatively to assail democracy itself - than when parties and citizens endorse the performance of regimes. Parties are cue-givers and an expanded choice set over the performance of a regime can potentially mobilize mass dissatisfaction. This possibility, too, calls for more empirical analyses of the reason why parties and citizens evaluate the performance of regimes critically, and how mass dissatisfaction with a democracy is articulated by political parties and linked to the views of publics about the performance of democracies—a topic that future research should attend to urgently.

Table 1: Examples of parties that are critical of national democratic institutions in 2013 and receive at least 10% of the vote

<i>Party name</i>	<i>Country</i>	<i>% of vote in previous election</i>	<i>Criticism of national institutional performance</i>	<i>Party family</i>
<i>Bundnis Zukunft Österreich/ Alliance for the Future of Austria (BZO)</i>	Austria	10.7	Calls for political reforms to abolish the Council and to replace its competences with the Landeshauptleutekonferenz in order to end the blocking politics by the provinces	Nationalist
<i>Anexartitoi Ellines/ Independent Greeks (ANEL)</i>	Greece	10.6	Strong anti-austerity party: sees Greek national institutions as subservient to the Troika.	National/conservative
<i>Partito Democratico/ Left Democrats (PD)</i>	Italy	25.4	Critical of the 2005 electoral system and of co-equal bicameralism	Liberal
<i>Il Popolo della Libertà/ The People of Freedom (PDL)</i>	Italy	21.6	Critical of the 2005 electoral system and of co-equal bicameralism; questioned legitimacy of the judiciary and the constitutional court	Christian democrat
<i>Liberal Democrats (LD)</i>	United Kingdom	23.0	Committed to reform of electoral laws and significant change in second chamber/House of Lords	Liberal
<i>Veci Verejne/ Public Affairs (VV)</i>	Czech Republic	10.9	Opposed to corruption and in favour of political transparency, supports direct democracy	Conservative liberal
<i>Eesti Keskerakond/ Estonian Centre Party (EK)</i>	Estonia	23.3	Critical of electoral laws which leave many in the Russian minority without voting rights associated with authoritarian populist positions	Liberal/populist
<i>Magyar Szocialista Party/ Hungarian Socialist Party (MSZP)</i>	Hungary	19.3	Strongly critical of the constitutional reforms of Fidesz	Social democratic
<i>Reform Partija/ Reform Party (RP)</i>	Latvia	20.8	Strongly critical of the 'oligarchical' nature of party competition and poor representation	Centrist
<i>Darbo Partija/ Labour Party (DP)</i>	Lithuania	19.8	Strongly critical of legal system – its leader was convicted of tax fraud and protected from prison by parliamentary immunity	Centrist
<i>Partidul Noua Republica / New Republic Party (PNR)</i>	Romania	16.5	Strongly critical of the corrupt political establishment and party-elites; proposed direct presidential elections	Conservative
<i>Obyčajní L'udia a Nezavisle Osobnosti/ Ordinary People and Independent Personalities (OL'Ano)</i>	Slovakia	14.7	Exposed the links between powerful business interests and political elites emerging from the 'Gorilla' scandal to suggest how imperfectly democratic institutions were working	Conservative

Table 2: Predicting Parties' Regime Evaluations (2013)

Part-level predictors:	Model 1	2	3	4	5	6	7
<i>% Postwar incumbent</i>		1.533** (0.437)	1.333** (0.431)	1.330** (0.425)	1.326** (0.425)	1.297** (0.424)	1.554** (0.437)
